Abstract

The Internet of Things (IoT) ecosystem is that smart, helping people in making more responsible choices in real-time. The IoT is a rapidly growing phenomenon which also provides automation, self-aware nature and so on. For a sustainable Data Center, these IoT devices are used to reduce the work and make the process less with better result. This paper provides a study of energy efficiency and CO_2 emissions in a sustainable data center. Thus this paper helps to understand the knowledge gap in sustainable IoT ecosystem.
