

The Revolution is Here:  
Fully digital tray management, with  
implant usage scanning

**Introducing Velox, the first  
in-field surgical implant  
usage scanning solution.**

 **SUMMATE**  
TECHNOLOGIES  
DIGITAL OPERATIVE

# Put Scan in Your Plan...

- Scan and track implant usage directly from the sterile field.
- Scan consumables and biologics into the field as used.
- Scan set instruments back into the correct sets in SPD.

Velox Software  
Captures All Usage Data

Surgical Technician Scans  
Implant Usage During Surgery

Summate scans implants  
and consumables  
at point of use during surgery

Summate's reading  
wand sterilizes

Summate's proprietary TagTape® microchip\* marking technology can tag implant trays so that implant usage can now be scanned and tracked from the sterile field during surgery, by the surgical technician.

Summate's Modality™ label allows the surgical technician to control implant disposition (add to patient, return to tray, and wasted) directly from the surgical field.

\*p-Chip®, PharmaSeq, Monmouth Junction, NJ

The first fully digital system that connects and automates all aspects of the implant supply chain - from O.R. use to reorder to restock.

Scanning asset usage at the point of use is the gateway to efficient supply chain management. It's the gold standard, and scanning is utilized in every industry in the modern world. In fact, scanning is used in the hospital at every level - pharmacy, central supply, and on the floor. Now its available for your largest profit center - the operating room.

## Mark and Build Trays and database

### Select Trays

Summate will work with your facility to designate trays for digital management. Choose to start with one area (ie small frag trauma) or choose your entire orthopedic inventory - it's up to you.

### Tag Trays

Summate has several patented marking technologies that will quickly, easily and safely retrofit your trays so implant usage can be scanned. TagTape is certified FDA confident for sterility, and guaranteed to last 500 cycles. TagTape can be replaced/maintained quickly and easily.

### Build Database

Summate will build your secure database for digital management of your implant trays and consumable assets.

## Scan At point of use

### Touchscreen Interface

Summate's Simplicity software is designed for touchscreen use, so its easy and intuitive to learn and use. It takes a minimum of training for staff to gain proficiency.

### Einstein Datacart

Summate's Einstein datacart has a narrow footprint, so its designed to fit ergonomically into the OR environment. It's wireless and has a battery powered option.

Einstein works with both our sterile wand scanner (for tracking implant usage) and a standard optical scanner (for scanning consumables used during surgery).

Scanning will free up nurse time for patient and surgeon care.

## Manage The Digital Operative

### Free up circulating nurse time:

Studies show that up to 40% of circulating nurse time is spent manually inputting implant and consumable data during surgery. Free up this time for patient and surgeon care instead of tedious data entry.

**Increase accuracy:** Scanning at point of use will increase accuracy of supply chain data. Reduce billing discrepancies at the purchasing level, create more accurate patient records for implants, and dramatically reduce supply chain steps.

### Capture costs, lower costs:

Capture all costs through scanning, and lower costs through transparency of case cost with real time cost reporting at the OR level.

**Every other hospital department (pharmacy, central supply, the floors) scans asset usage.  
Why not the the biggest profit center, the operating room?  
Put Scan in your Plan.**
