

Meaning of Symbols on Remote Controls

While there are many different brands of air conditioning and as such remote controls, most symbols are the same, here are a few basic symbols to remember

The heating is generally identified by the symbol of the sun.

The cooling function (or typical ac function) is identified by the snow or snowflake symbol.

The dehumidifier, the droplet symbolises water and thus is the symbol used for the setting that is programmed in the air conditioner directing it to collect moisture from the environment.

The power button used to switch the air conditioner on and off in most cases, is identified by a symbol with a circle and a vertical line in the middle.

The fan clearly indicates and controls the flow of air to enter into the environment. Pressing the button several times you can cycle through the different fan speeds, those available are low, medium, high and automatic/auto speeds. Auto provides for a fully automatic management of the fan speed, setting the maximum, high capacity in the initial phase, and then decreasing slowly as it reaches the temperature in the environment until it reaches the minimum speed.

The swing button is indicated by the icon of the two opposing, barred arrows; on some air conditioners it is indicated with the word swing. This icon corresponds to a setting that allows the air conditioner to oscillate from top to bottom and vice versa which enables the air to be distributed from different angles. If the button is pressed during the oscillation stage, the flaps will be locked in that position.

The temperature is indicated by the ° C symbol, which is usually positioned on a larger button than those used for the other functions. This assumes a vertical or horizontal form, at whose ends there are arrows to raise or lower the temperature.
