

National Day of Action May 15th • 2019

TALKING POINTS

- Wireless radiation is a proven health risk, and our children are uniquely vulnerable.
 - We have hundreds of scientific studies documenting harm
- The deployment of small cells near homes and apartments all across America will result in the involuntary exposure of millions of individuals and families.
 - This is an exponential increase in exposure.
- The exposure guidelines of the FCC are more than 30-years-old, and do not consider proven biological harm.
 - A recent study by the U. S. National Institutes of Health showed "clear evidence" of cancer from exposure to wireless radiation.
- We are not against technology, but we're opposed to the roll-out of technology that has not been proven safe.
 - There are no studies to support the industry's claim of safety.
- Children will now be exposed to a proven health hazard 24/7 – at home, at school and in places where they play.
 - Young children have a longer lifetime ahead of them to experience negative health outcomes.
 - The telecoms are taking away a parent's right to protect their child from harm.
- The solution is fiber optic to the premises (FTTP): it's faster, more secure, more reliable.
 - 5G wireless depends on fiber optic to the pole anyway
