

ABSTRACT

It should be time to study and apply a mathematical accounting model which is easy to understand and audit, and is accurate and reliable. The paper distinctly describes three accounting's concepts or models (physical accounting model, double-entry system model, and mathematical accounting model) and their relationship. The physical accounting model naturally exists since business emerging and is the base of all other accounting models. The physical accounting model is actually consisted of every transaction which is based on a principle: exchange of equal values. The double-entry system model, which is still used all over the world, uses a logical method to keep recording transactions accurate. Its main characters are the T account with debit and credit, chart of accounts, two classes of permanent and temporary accounts, and trial balance. The mathematical accounting model is based on a basic expanding accounting equation and has developed following main characters: mathematical axiom principle, dynamic accounting equation, sub-equation of the dynamic accounting equation, five classes of permanent accounts, MultiSubaccount name, structures of financial statements, and account flow statement. The same parts of the double-entry system and mathematical accounting models are to satisfy the basic accounting equation at the beginning of a fiscal year and the ending of a fiscal year, but the difference of them is that they take the different ways to reach the ending of the fiscal year. Based on the mathematical accounting model, I have developed a MathAccounting software. The MathAccounting software has four function models: Transactions, Reports, Backup/Restore, and Maintenances which will be introduced in detail. The MathAccounting software has little limitation, so the MathAccounting software can be used by all economic entities regardless of their size, nature of business, or form of business organization without any altering. The paper also introduces a concept of the great accounting, which is based on the MathAccounting software and the wealth conservation law, in detail. The great accounting means two aspects. In the great data time, centered management of accounting is an inexorable trend. Every business company can login in a

government's centered database by using of its business number. And every department in an organization can do part work of the accounting about itself duty. All works of the organization's departments will be made up of the financial statements. The great accounting has many advantages, such as being difficult to draw up false accounts and to evade a tax.

Keywords: physical accounting model, double-entry system accounting model, mathematical accounting model, MathAccounting software, and great accounting

1. Introduction of Mathematical Accounting Model

It should be time to study and apply a mathematical accounting model which is easy to understand and audit, and is accurate and reliable. Meanwhile, accounting students should take a course of database at least, such as SQL Server or Oracle, to understand the mathematical accounting model clearly.

Three important accounting's concepts or models and their relationship can be identified clearly. They are the physical accounting model, the double-entry system model, and the mathematical accounting model.

1.1 Physical Accounting Model

First, what is the physical accounting model? Since business emerging, the physical accounting model naturally exists. The physical accounting model is the base of all other accounting's models and is consisted of every transaction. These transactions are naturally based on a principle: exchange of equal values. By using of mathematical language, each transaction based on this principle means each sub-equation, which actually implies a basic accounting equation.

1.2 Double-Entry System Model

For knowing and understanding business performance, people has tried to build many accounting models to record and summarize the economic events in fact, such as an owner of a corner grocery store who might use a very simple accounting model to record his or her transactions. Just like a saying that all roads lead to Rome.

Without effective computing tools, the double-entry system model actually uses a logical method to keep recording transactions accurate, so this double-entry system accounting model has gradually become popular in the world and is still used all over the world now. It has following main characters:

- T account with debit and credit. The principle of exchange of equal values implies that the sum of the debit is equal to the sum of the credit in a transaction here.
- Chart of accounts. It is the framework for entire database of the current accounting software.

- Permanent and temporary accounts. All accounts are divided into two classes of accounts: permanent and temporary accounts. The Assets, Liabilities, and Owner's equity are the permanent accounts. The Revenues and Expenses are the temporary accounts which will be closed at the end of every fiscal year and be merged into the Owner's Equity in the basic accounting equation. Its basic accounting equation is: $\text{Assets} = \text{Liabilities} + \text{Owner's Equity}$
- The basic accounting equation with rules and effects on each type of account:

$$\text{Assets} = \text{Liabilities} + \text{Owner's Equity}$$

$$\text{Assets} = \text{Liabilities} + \text{Capital} - \text{Drawings} + \text{Revenues} - \text{Expenses}$$

Dr.	Cr.	Dr.	Cr.	Dr.	Cr.	Dr.	Cr.	Dr.	Cr.	Dr.	Cr.
+	-	-	+	-	+	-	+	-	+	+	-

- General Journal.
- Posting to ledger.
- Trial balance. The trial balance calculation is an obvious symbol of deviating from the basic accounting equation because the amount of the total debit or total credit is normally not equal to the amount of the total assets or the sum of the total liabilities and total equity (the two sides' amounts of the dynamic accounting equation). The double-entry system only checks the recording information by using of the basic accounting equation at the end of a fiscal year.

1.3 Mathematical Accounting Model

Last concept is the mathematical accounting model. In the mathematical accounting model, it is very important that the basic accounting equation must be an expanding form of the "Assets = Liabilities + Equity + Incomes – Expenses". Based on this equation, the mathematical accounting model has developed following main

characters:

- Mathematical axiom principle.
- Dynamic accounting equation.
- Sub-equation of dynamic accounting equation. Every transaction is a sub-equation which is also called general equation.
- Five classes of the accounts. All accounts are divided into five classes of the accounts which are all the permanent accounts and have same position in the dynamic accounting equation. This concept is very important for developing the mathematical accounting model. The Assets are the first class of accounts, the Liabilities are the second class of accounts, the Equities are the third class of accounts, the Incomes are the fourth class of accounts, and the Expenses are the fifth class of accounts.
- MultiSubaccount name. Its form is the “A3<A2<A1”. The A1, A2, and A3 is the parent account’s one-level subaccount, two-level subaccount, and three-level subaccount names respectively.
- Structures of financial statements.
- Concept of account flow statement.

The mathematical accounting model is based on following mathematical axiom.

$$\text{If} \quad a + b = c + d,$$

$$e + f = g + h,$$

$$\text{Then} \quad a + b + e + f = c + d + g + h$$

The mathematical axiom is the nucleus and framework of the mathematical accounting model, and is through all process of accounting. Meanwhile, the mathematical axiom also guarantees the recording accounting information correct and accurate.

In the mathematical accounting model, it is a great advantage that the increasing of an account’s balance is the

“+” and the decreasing of an account’s balance is the “-” for all accounts of the assets, liabilities, equities, incomes, and expenses, which is as same as personal habit.

The basic accounting equation is rewritten and categorized, and I get following dynamic accounting equation.

$$\text{Assets (1)} = \text{Liabilities (2)} + \text{Equity (3)} + \text{Incomes (4)} - \text{Expenses (5)}$$

In the above equation, each class account has many accounts, so the dynamic accounting equation can be again rewritten as an expanding dynamic accounting equation.

$$\begin{aligned} \text{Assets (1) (Cash + Inventory + ...)} &= \text{Liabilities (2) (Account Payable + Notes Payable + ...)} \\ &+ \text{Equity (3) (Share capital + Retained earnings + ...)} \\ &+ \text{Incomes (4) (Revenues + Other Revenues + ...)} \\ &- \text{Expenses (5) (Cost of Sales Sold + Interest Expenses + ...)} \end{aligned}$$

In fact, every transaction is a sub-equation of a dynamic accounting equation. If adding a sub-equation to previous dynamic accounting equation, then I get a new dynamic accounting equation at a special time point. If you image that the accounting is a straight railway system, then every transaction is a railway sleeper and the train is a dynamic accounting equation and goes ahead. Each account does not need be closed. The financial statements are only the results of the moving and uniting the some terms in the dynamic accounting equation at a special time point.

What is relationship between the double-entry system model and the mathematical accounting model? The

Figure 1 can clearly show the answer and explain the question.

Figure 1 Same Parts and Difference of two Accounting Models

If you think that the time of a fiscal year is a stretch of rail, then the starting point of the rail is regarded as the beginning of the fiscal year and the destination of the rail is regarded as the ending of the fiscal year. The same parts of the two accounting models are to satisfy the basic accounting equation at the starting point of the rail (the beginning of the fiscal year) and the destination of the rail (the ending of the fiscal year), but the two accounting models take the different ways to reach the destination from the starting point.

The mathematical accounting model drives on the rail track all the time until reaching the destination. The train is the dynamic accounting equation. Every railway sleeper is a sub-equation which is also called as a general equation in the MathAccounting software. The train is driving on the railway, which means that every sub-equation is being added to previous dynamic accounting equation. When the train reaches the destination of the rail, the last dynamic accounting equation is finally gotten at the ending of the fiscal year.

The double-entry system model leaves the rail track at the starting point after all ledger accounts being checked

to satisfy the basic accounting equation, and takes the other road to reach the destination. The road is consisted of all T accounts with debit and credit, general journalizing transactions, and chart of accounts which is the framework of this model. The car is consisted of posting to ledger accounts and trial balance calculating. After reaching the destination, all ledger accounts must be checked again to satisfy the basic accounting equation.

In the mathematical accounting model, following five transactions can be written by using five sub-equations.

- Investment by owners. On January 2, 2014, Ping Wang, Hua Li and Mike Newsome decide to open a RR trade business, so Ping Wang invests \$4,000 cash in business, and Hua Li and Mike Newsome each invest \$3,000 cash in business. The sub-equation can be written as following:

$$\begin{aligned} \text{Cash (1): } 10000 &= \text{Share capital (3): } 4000 + \text{Share capital (3): } 3000 \\ &+ \text{Share capital (3): } 3000 \end{aligned}$$

This sub-equation is also the dynamic accounting equation on January 2, 2014 (in other word, the first dynamic accounting equation is the “0 = 0” for a new company). It can be rewritten as following:

$$\text{Cash (1): } 10000 = \text{Share capital (3): } 10000$$

- Purchase of the supplies by cash. On January 3, 2014, RR purchases some supplies by \$193 cash from AA company. Then the sub-equation is:

$$\text{Cash (1): } -193 + \text{Supplies (1): } 193 = 0$$

Adding this sub-equation to the previous dynamic accounting equation, I get a new dynamic accounting equation on January 3, 2014. The dynamic accounting equation is:

$$\text{Cash (1): } 9807 + \text{Supplies (1): } 193 = \text{Share capital (3): } 10000$$

- Cash payments for Hua Li’s taxi fee expenses. On the same day, Hua Li takes taxi to carry on the supplies by \$47 cash. Then the sub-equation is:

$$\text{Cash (1): } -47 = - \text{Travelling expenses (5): } 47$$

On the same day, the new dynamic accounting equation after adding this transaction is:

$$\text{Cash (1): } 9760 + \text{Supplies (1): } 193 = \text{Share capital (3): } 10000 - \text{Travelling expenses (5): } 47$$

- Purchase of inventory by some cash and other on credit. On January 5, 2014, RR purchases \$3,670 inventory by \$670 cash and other on credit from A1 company (phone number: 987654321). Then the sub-equation is:

$$\text{Cash (1): } -670 + \text{Inventory (1): } 3670 = \text{Account payable (2): } 3000$$

On January 5, 2014, the new dynamic accounting equation after adding this transaction is:

$$\text{Cash (1): } 9090 + \text{Supplies (1): } 193 + \text{Inventory (1): } 3670 = \text{Account payable (2): } 3000$$

$$+ \text{Share capital (3): } 10000 - \text{Travelling expenses (5): } 47$$

- Sales for some cash and other on credit. On January 5, 2014, RR sells \$1,900 inventory to B1 Company (phone number: 123456789) for sales of \$2,530, and receives cash 300. Then the sub-equation is:

$$\text{Cash (1): } 300 + \text{Inventory (1): } -1900 + \text{Account receivable (1): } 2230 = \text{Sales (4): } 2530$$

$$- \text{Cost of sales (5): } 1900$$

On the same day, the new dynamic accounting equation after adding this transaction is:

$$\text{Cash (1): } 9390 + \text{Supplies (1): } 193 + \text{Inventory (1): } 1770 + \text{Account receivable (1): } 2230$$

$$= \text{Account payable (2): } 3000 + \text{Share capital (3): } 10000 + \text{Sales (4): } 2530$$

$$- \text{Travelling expenses (5): } 47 - \text{Cost of Sales (5): } 1900$$

In a word, the sub-equation of first transaction is also the dynamic accounting equation on January 2, 2014.

Adding second transaction's sub-equation to this dynamic accounting equation, I get a new dynamic accounting equation on January 3, 2014. Finally, I get a new dynamic accounting equation on January 5, 2014. It is:

$$\text{Cash (1): } 9390 + \text{Supplies (1): } 193 + \text{Inventory (1): } 1770 + \text{Account receivable (1): } 2230 =$$

Account payable (2): 3000 + Share capital (3): 10000 + Sales (4): 2530

– Travelling expenses (5): 47 – Cost of Sales (5): 1900

The total assets are \$13,583, and total sum of liabilities, equity, Incomes, and expenses are \$13,583 too. By moving and uniting the terms from the dynamic accounting equation at a time point, I can easily get income statements, balance sheet, cash flows statement, and so on.

Real business is more complicate than this example. Moreover many accounts have multi-level subaccounts, such as the account of the “Travelling Expenses”. It may have three-level subaccounts (different persons, different departments, and different factories). In fact, there is obviously an account which has one-level subaccounts in this example. Do you find it? It is the account of the “Share capital” that is consisted of the three one-level subaccounts: Capital-Ping Wang, Capital-Hua Li, and Capital-Mike Newsome.

For dealing with complicate business, effective computing tool of SQL Database or Oracle Database must be used. For meeting the requirement of SQL Database or Oracle Database, the above basic dynamic accounting equation must be rewritten by using of mathematical language. It is:

$$X1 = X2 + X3 + X4 - X5$$

Here the X1 is the assets, X2 is the liabilities, X3 is the equity, X4 is the incomes, and X5 is the expenses.

The expanding dynamic accounting equation is:

$$(X11 + X12 + X13 + \dots) = (X21 + X22 + X23 + \dots) + (X31 + X32 + X33 + \dots) \\ + (X41 + X42 + X43 + \dots) - (X51 + X52 + X53 + \dots)$$

All terms in the above equation are called parent accounts, and will appear on the financial statements.

If an account, such as the X12, has one-level subaccounts, then its one-level subaccounts are the X121, X122, X123, and so on.

If an account, such as the X41, has two-level subaccounts, then its one-level subaccounts are the X411, X412,

X413, and so on. The one-level subaccounts may have their two-level subaccounts. For a one-level subaccount, such as the X 412, its two-level accounts are the X4121, X4122, X4123, and so on.

If an account, such as the X53, has three-level subaccounts, then its one-level subaccounts are the X531, X532, X533, and so on. The one-level subaccounts may have their two-level subaccounts. For a one-level subaccount, such as the X533, its two-level accounts are the X5331, X5332, X5333, and so on. For a two-level subaccount, such as the X5331, its three-level subaccounts are the X53311, X53312, X53313, and so on. From theory, an account can have the infinite-level subaccounts.

So, the expanding dynamic equation is very huge and very complicate for a company with many three-level subaccounts. You do not worry about that. The computer can do difficult calculating and categorizing work behind the screen. You must only understand a basic principle. When a sub-equation, which is the lowest-level sub-equation and is checked to be correct, is added to previous dynamic accounting equation, the all terms of the sub-equation will be added to its relevant parent accounts and subaccounts.

There is a problem which must be technically solved. If a parent account X11 has more than 10 one-level subaccounts, such as 22 one-level subaccounts, then the twelfth one-level subaccount X1112 may be confused with a two-level subaccount X1112 of the one-level subaccount X111 by the computer. For resolving the problem, every parent account and its multi-level subaccount are represented by using of two digital numbers if the maximum number of them is less than 100.

The expanding dynamic accounting equation is rewritten as:

$$(X101 + X102 + X103 + \dots + X199) = (X201 + X202 + X203 + \dots + X299) + (X301 + X302 + X303 + \dots + X399) + (X401 + X402 + X403 + \dots + X499) - (X501 + X502 + X503 + \dots + X599)$$

If the parent account X197 has the 99 one-level subaccounts, then its 6th one-level subaccount is the X19706 and 99th one-level subaccount is the X19799.

Figure 2 Structures of Balance Sheet and Income Statements

To design own balance sheet and income statement, a user can enter subtotal name into the big box at the left of the Figure 2 and its row number into the right box; the user need also enter parent account name into the small box at the left of the Figure 2 and the account's row number into the right box. Obviously, the two row numbers cannot be same. The two row numbers must not be sequence, but they must be in a scope, such as a scope of 201 to 301. Because each scope is enough for all possible parent accounts, I recommend that the row number of a new subtotal name will be odd number and a new parent account's row number will be even number. If a company has any income that must not pay tax or any expense that cannot be deducted, you can put them under the parent account of the "Income taxes expenses". Their row numbers should be between 600 and 650.

The subtotal names and the parent account names will appear in the income statements and the balance sheet in the order of the numbers that the user entered.

For above first transaction, a user can enter a subtotal name of the "Current assets" into the big box at the left of the Figure 2 and the number "103" or other appropriate number you like into the right box; the user need also enter the account of the "Cash" into the small box at the left of the Figure 2 and its row number "104" or other appropriate number you like into the right box. Then the user can enter a subtotal name of the "Owners' capital" into the big box at the left of the Figure 2 and the number "303" or other appropriate number you like into the right box; the user need also enter the account of the "Share capital" into the small box at the left of the Figure 2 and the number "304" or other appropriate number you like into the right box.

I can use the tool of subaccount concept to build cash flows statement. The Figure 3 shows the structure of the cash flows statement.

A					
			Net cash provided by A		
B					
			Net cash provided by B		
C					
			Net cash provided by C		
Net change in cash					
Beginning, ...					
Ending, ...					

Figure 3 Structure of Cash Flow Statement

The cash account has three one-level subaccounts: operating activities, investing activities, and financing activities. Of course, every one-level subaccount can have the unlimited two-level subaccounts. The contents of the big boxes at the left of the Figure 3 are the names of the one-level subaccounts, and the contents of the small boxes at the left of the Figure 3 are the names of the two-level subaccounts; the contents of the right boxes are all two-level subaccounts' balances which can be gotten from the tables which I will create below.

If cash is paid to a supplier for inventory, then its one-level subaccount name is the "Operating activities" and its two-level subaccount is the "Cash payments to suppliers". If cash is paid for a machine, then its one-level subaccount is the "Operating activities" and its two-level subaccount name is the "Cash payments of machinery".

The one-level subaccounts' names of the "Operating activities" and the "Investing activities" will appear in the

A and B boxes respectively. The two-level subaccounts' names of the "Cash payments to suppliers" and the "Cash payments of machinery" will appear in the small boxes under A and B respectively. So I can design my style of cash flows statement by using of this structure. At the ending of every fiscal year, I can get the cash flows statement from the tables which I will create below. In fact, I can get the cash flows statement just clicking a box in the MathAccounting software. It is so easy.

From this idea, I can get a new concept of account flow statement if an account has the two-level subaccounts. If number of its one-level subaccounts is more than three, then the top three one-level subaccounts' names will appear on the account flow statement.

For account receivable and account payable accounts, they only have different customers and different suppliers respectively. Because each customer or each supplier's telephone number is sole, I can use the tool of subaccount concept again to think that the customers' or suppliers' telephone numbers are the one-level subaccounts' names of the account receivable or the account payable.

So far, a new parent account has following items that a user must enter at most:

- Transaction Date
- General ID
- Explanation
- Class (1-5)
- MultiSubaccount name (its form of the "A3<A2<A1"). All subaccounts being sole
- Amount
- Subtotal Name (including its row number and its form of the "subtotal name, its row number")
- Reference (account row number, or account receivable or account payable's General ID)

For a new customer or supplier, the information of customer or supplier's name, address, E-mail, postal code,

city, state, and country must also be entered too.

The Figure 4 shows a sample of original proof of a transaction.

Figure 4 Original Proof of Transaction

In filling in an original proof, you must change the amounts of the fifth class accounts to the negative amounts.

I will show you the process of recording the accounting information by using of the mathematical accounting

model without the database.

For calculating the parent accounts' and the subaccounts' balances after a transaction, the following steps must be done.

First, a transaction sub-equation must be built after filling in an original proof. Then, the sub-equation must be changed to a mathematical sub-equation.

Second, all subaccounts in the transaction must be identified to build the multi-level sub-equations. All terms or items' amounts in the lowest-level sub-equation can be gotten from the transaction original proof directly.

Third, when the three-level sub-equation is added to the two-level sub-equation or when the two-level sub-equation is added to the one-level sub-equation, the lower level subaccounts' amounts are added to upper level subaccounts' amounts (them belonging to the same parent account). However, the amounts for two same terms must not be added together, which means that their amounts do not change. When the one-level sub-equation is add to the transaction sub-equation, all parent accounts' amounts can respectively be gotten from their related one-level subaccounts.

Finally, for getting the parent accounts' balances after the transaction, the transaction sub-equation must be added to a previous dynamic accounting equation. For recording the transaction and getting the parent accounts and all related subaccounts' balances, I must design and fill in the related tables.

The Figure 5 shows the original proof of first transaction.

Figure 5 Original Proof of First Transaction

First, the transaction sub-equation is the “Cash (1) = Share capital (3)”. Because the “Cash” is first parent account of writing into 1 class accounts (X1) table and the “Share capital” is also first parent account of writing into 3 class accounts (X3) table, the transaction’s mathematical sub-equation is the “X101 = X301”.

Second, the account of the X101 has the two-level subaccounts and the account of the X301 has the one-level subaccounts, so the one-level and the two-level expanding mathematical sub-equations are the following:

$$\text{One-level sub-equation} \quad X10101 = X30101 + X30102 + X30103$$

$$\text{Two-level sub-equation} \quad X1010101 = X30101 + X30102 + X30103$$

From the Figure 5, the X10101 is the “Financing activities” and X1010101 is the “Cash receipts from owners”; the X30101, X30102, and X30103 are respectively the “Capital-Ping Wang”, “Capital-Hua Li”, and “Capital-Mike Newsome”. In addition, the terms of the X1010101, X30101, X30102, and X30103 in the above two-level sub-equation are the lowest subaccounts of their parent accounts in this transaction, so their amounts are \$10,000, \$4,000, \$3,000, and \$3,000 respectively.

Third, when the two-level sub-equation is added to the one-level sub-equation, the amount of the upper subaccount X10101 is \$10,000 (= X1010101) and the amounts of the X30101, X30102, and X30103 do not change. When the one-level sub-equation is added to the transaction sub-equation, the amount of the parent account X101 is \$10,000 (= X10101) and the amount of the parent account X301 is \$10,000 (= X30101 + X30102 + X30103).

Finally, for getting the balances of all related parent accounts and their subaccounts, I should create some tables: General equation, Class accounts, Parent accounts, and subaccounts. Then I fill in these tables with this transaction information and calculate their balances. The Table 1 shows the general equation, the Table 2 shows the class accounts of the assets accounts (X1) and the shareholders’ equity accounts (X3), and the Table 3 shows the parent accounts of the “Cash(X101)” and the “Share capital(X301)”. The Table 4 shows the one-level subaccounts of the “Financing activities(X10101)”, the “Capital-Ping Wang(X30101)”, the “Capital-Hua Li(X30102)”, and the “Capital-Mike Newsome(X30103)”. The Table 5 shows the two-level subaccount of the “Cash receipts from owners(X1010101)”.

Table 1 General equation

Table 5 Two-level subaccount

Cash receipts from owners (X1010101) << Parent account: Cash (X101)

ID	MultiName	Amount	Ref	GeID	Transaction Date	Balance
1	Cash receipts from owners<Financing activities	10000		1	2014-1-2	10000

I write the lowest subaccounts' amounts into their tables respectively and calculate their balances. The table "Cash receipts from owners (X1010101)" in the Table 5 is the lowest subaccount (two-level subaccount) of the parent account "Cash(X101)", so I write the \$10,000 into this table in the Table 5. The three tables of the "Capital-Ping Wang(X30101)", the "Capital-Hua Li(X30102)" , and the "Capital-Mike Newsome(X30103)" in the Table 4 are the lowest subaccounts (one-level subaccounts) of the parent account "Share capital(X301)", so I respectively write the \$4,000, \$3,000, and \$3,000 into the three tables in the Table 4.

Another table "Financing activities (X10101)" in the Table 4 can be gotten from the table "Cash receipts from owners (X1010101)" in the Table 5. The parent accounts of the "Cash(X101)" and the "Share capital(X301)" in the Table 3 can be respectively gotten from the table of the "Financing activities (X10101)" and the tables of the "Capital-Ping Wang (X30101)", the "Capital- Hua Li (X30102)", and the "Capital-Mike Newsome (X30103)" in the Table 4.

The two tables' balances in the Table 2 can be gotten from the two tables of the "Cash(X101)" and the "Share capital(X301)" in the Table 3 respectively.

In fact, database can do the work easily. After entering the transaction, the database has created two tables of parent accounts of the "Cash(X101)" and the "Share capital(X301)", and calculated their balances. Meanwhile, the tables of all subaccounts (including one-level subaccounts of the "Financing activities(X10101)", the "Capital-Ping Wang(X30101)", the "Capital-Hua Li(X30102)", and the "Capital-Mike Newsome(X30103)" and two-level subaccount of the "Cash receipts from owners(X1010101)") and their balances can be gotten by using of the database query.

The Figure 6 shows the original proof of second transaction.

Figure 6 Original Proof of Second Transaction

The transaction equation is the “Cash (1) + Supplies (1) = 0”. Because the “Supplies” is second parent account of writing into 1 class accounts (X1) table, the transaction’s mathematical equation is the “X101 + X102 = 0”.

The account of the X101 has the two-level subaccounts and the account of the X102 has not any subaccount, so the one-level and the two-level expanding mathematical sub-equations are the following:

$$\text{One-level sub-equation} \quad X10102 + X102 = 0$$

$$\text{Two-level sub-equation} \quad X1010201 + X102 = 0$$

From the Figure 6, the X10102 is the “Operating activities” and the X1010201 is the “Cash payments for operating expenses”. The amounts of the X1010201 and the X102 in the two-level sub-equation are respectively -\$193 and \$193.

When the two-level sub-equation is added to the one-level sub-equation, the amount of the upper subaccount X10102 is -\$193 (= X1010201) and the amount of the parent account X102 does not change. When the one-level sub-equation is added to the transaction sub-equation, the amount of the parent account X101 is -\$193 (= X10102) and the amount of the parent account X102 is \$193 (= X102).

For recording the transaction, I should create three tables of the parent account “Supplies(X102)”, one-level subaccount “Operating activities(X10102)”, and the two-level subaccount “Cash payments for operating expenses(X1010201)”, and calculate their balances. The two tables of the general equation and the parent account “Cash(X101)” have existed, so I should only update their information.

The Table 6 shows the general equation, the Table 7 shows the class accounts of the assets accounts(X1), the Table 8 shows the parent accounts of the “Cash(X101)” and “Supplies(X102)”, the Table 9 shows the one-level subaccount “Operating activities(X10102)”, and the Table 10 shows the two-level subaccount “Cash payments for operating expenses(X1010201)”.

Table 6 General equation

GeID	Transaction Date	General Equation	Left Amount	Right Amount	Explanation	Enter Date

ID	MultiName	Amount	Ref	GeID	Transaction Date	Balance
1	Cash payments for operating expenses<Operating activities	-193		2	2014-1-3	-193

I write the lowest subaccounts' amounts into their tables respectively and calculate their balances. The table "Cash payments for operating expenses(X1010201)" in the Table 10 is the lowest subaccount (two-level subaccount) of the parent account "Cash(X101)", so I write the -\$193 into this table in the Table 10. Because the parent account "Supplies(X102)" has not any subaccount, I write the \$193 into the parent account table "Supplies(X102)" in the Table 8.

The table "Operating activities(X10102)" in the Table 9 can be gotten from the table "Cash payments for operating expenses(X1010201)" in the Table 10.

The parent account of the "Cash(X101)" can be gotten from the table of the "Operating activities(X10102)" in the Table 10.

The balances of the table "Assets(X1)" in the Table 7 can be gotten from the tables of the "Cash(X101)" and the "Supplies(X102)" in the Table 8.

The Figure 7 shows the original proof of third transaction.

Figure 7 Original Proof of Third Transaction

The transaction equation is the “Cash (1) = Travelling expenses (5)”. Because the “Travelling expenses” is first parent account of writing into 5 class accounts (X5) table, the transaction’s mathematical equation is the “X101 = X501”.

The accounts of the X101 and X501 have the two-level subaccounts, so the one-level and the two-level expanding mathematical sub-equations are the following:

One-level sub-equation X10102 = X50101

Two-level sub-equation X1010201 = X5010101

From the Figure 7, the X10102 is the “Operating activities” and X1010201 is the “Cash payments for operating

expenses”; the X50101 is the “Purchase Department-Travelling” and X5010101 is the “Hua Li-travelling”.

The Same method can be used to calculate the amounts of the parent accounts and their subaccounts.

For recording the transaction, I should create three tables of the parent account “Travelling expenses(X501)”, one-level subaccount “Purchase Department-travelling(X50101)”, and the two-level subaccount “Hua Li-travelling(X5010101)”, and calculate their balances. The tables of the parent account “Cash(X101)”, the one-level subaccount “Operating activities(X10102)”, and the two-level subaccount “Cash payments for operating expenses(X10102001)” have existed, so I should only update their information.

The Table 11 shows the general equation, the Table 12 shows the class accounts of the assets accounts(X1) and the expenses accounts (X5), the Table 13 shows the parent accounts of the “Cash(X101)” and “Travelling expenses(X501)”, the Table 14 shows the one-level subaccounts of the “Operating activities(X10102)” and the “Purchase Department-travelling(X50101)”, and the Table 15 shows the two-level subaccounts of the “Cash payments for operating expenses(X1010201)” and the “Hua Li-travelling(X5010101)”.

Table 15 Two-level subaccounts

Cash payments for operating expenses (X1010201) << Parent account: Cash (X101)

ID	MultiName	Amount	Ref	GeID	Transaction Date	Balance
1	Cash payments for operating expenses<Operating activities	-193		2	2014-1-3	-193
2	Cash payments for operating expenses<Operating activities	-47		3	2014-1-3	-240

Hua Li-travelling (X5010101) << Parent account: Travelling expenses (X501)

ID	MultiName	Amount	Ref	GeID	Transaction Date	Balance
1	Hua Li-travelling< Purchase Department-travelling	-47		3	2014-1-5	-47

I write the lowest subaccounts' amounts into their tables respectively and calculate their balances. The two tables of the "Cash payments for operating expenses(X1010201)" and "Hua Li-travelling (X5010101)" in the

Table 15 are the lowest subaccounts (two-level subaccounts) of the parent accounts of the “Cash(X101)” and “Travelling expenses (X501)” respectively, so I write the -\$47 into the two tables in the Table 15 respectively.

The two tables of the “Operating activities(X10102)” and “Purchase Department-travelling (X50101)” in the Table 14 can be gotten from the two tables of the “Cash payments for operating expenses (X1010201)” and the “Hua Li-travelling (X5010101)” in the Table 15 respectively.

The two tables of the parent accounts of the “Cash(X101)” and the “Travelling expenses (X501)” in the Table 13 can be gotten from the two tables of the “Operating activities (X10102)” and the “Purchase Department-travelling (X50101)” in the Table 14 respectively.

The balances of the tables of the “Assets (X1)” and the “Expenses (X5)” in the Table 12 can be gotten from the two tables of the “Cash (X101)” and the “Travelling expenses (X501)” in the Table 13 respectively.

The Figure 8 shows the original proof of fourth transaction.

Transaction Original Proof

Figure 8 Original Proof of Fourth Transaction

The transaction equation is the “Cash (1) + Inventory (1) = Account payable (2)”. Because the “Inventory” is third parent account of writing into 1 class accounts (X1) table and the “Account payable” is first parent account of writing into 2 class accounts (X2) table, the transaction’s mathematical equation is the “X101 + X103 = X201”.

The account of the X101 has the two-level subaccounts, the account of the X103 has the three-level subaccounts, and the account of the X201 has the one-level subaccounts, so the one-level, the two-level and the three-level expanding mathematical sub-equations are the following:

One-level sub-equation $X10102 + X10301 = X20101$

Two-level sub-equation $X1010202 + X1030101 + X1030102 + X1030103 = X20101$

Three-level sub-equation $X1010202 + X103010101 + X103010102 + X103010201 + X103010202$
 $+ X1030103 = X20101$

From the Figure 8, the X10102 is the “Operating activities” and the X1010202 is the “Cash payments to suppliers”; the X10301, X1030101, X1030102, X1030103, X103010101, X103010102, X103010201, and X103010202 are respectively the “Inven1”, the “Inven11”, the “Inven12”, the “Inven13”, the “Inven111”, the

“Inven112”, the “Inven121”, and the “Inven122”; the X20101 is the “987654321”.

The Same method can be used to calculate the amounts of the parent accounts and their subaccounts.

For recording the transaction, I should create two tables of parent accounts of the “Inventory(X103)” and “Account payable(X201)”, and calculated their balances. Meanwhile, I should also create the tables of one-level subaccounts (including the “Inven1”, the “Inven2”, the “Inven3”, and the “987654321”), two-level subaccounts (including the “Cash payments to suppliers”, the “Inven11”, the “Inven12”, and the “Inven13”), and three-level subaccounts (including the “Inven111”, the “Inven112”, the “Inven121”, and the “Inven122”). The table of the parent account “Cash(X101)” has existed, so I should only update its information, including its subaccounts’ information.

The Table 16 shows the general equation. The Table 17 shows the class accounts of the assets accounts(X1) and the liabilities accounts(X2). The Table 18 shows the three parent accounts of the “Cash(X101)”, the “Inventory(X103)”, and the “Account payable(X201)”. The Table 19 shows the three one-level subaccounts of the “Operating activities”, the “Inven1”, and the “987654321”. The Table 20 shows the four two-level subaccounts of the “Cash payments to suppliers”, the “Inven11”, the “Inven12”, and the “Inven13”. The Table 21 shows the four three-level subaccounts the “Inven111”, the “Inven112”, the “Inven121”, and the “Inven122”. In addition, I should also create a table to record the suppliers’ information, seeing the Table 22.

Table 22 Suppliers information

ID	Supplier Phone	Supplier Name	Address	E-mail	Postal Code	City	State	Country
1	987654321	A1	A2	A3	A4	A5	A6	A7

I write the lowest subaccounts' amounts into their tables respectively and calculate their balances. The four

tables of the “Inven111 (X103010101)”, “Inven112 (X103010102)”, “Inven121 (X103010201)”, and “Inven122 (X103010202)” in the Table 21 are the lowest subaccounts (three-level subaccounts) of the parent account of the “Inventory (X103)” respectively, so I write the \$10*165, \$4*225, \$0.8*650, and \$5*66 into the four tables in the Table 21 respectively. The two tables of the “Cash payments to suppliers (X1010202)” and the “Inven13(X1030103)” in the Table 20 are the lowest subaccounts (two-level subaccounts) of the parent accounts of the “Cash(X101)” and the “Inventory(X103)” respectively, so I write the -\$670 and \$30*9 into the two tables in Table 20 respectively. The table of the “987654321 (X20101)” in the Table 19 is the lowest subaccount (one-level subaccount) of the parent account “Account payable (X201)”, so I write the \$3000 into this table in the Table 19. In addition, I also write the supplier’s information into the Table 22.

The two tables of the “Inven11(X1030101)” and the “Inven12(X1030102)” in the Table 20 can be gotten from the four tables of the “Inven111 (X103010101)”, “Inven112 (X103010102)”, “Inven121 (X103010201)”, and “Inven122 (X103010202)” in the Table 21 respectively.

The two tables of the “Operating activities(X10102)” and “Inven1 (X10301)” in the Table 19 can be gotten from the four tables of the “Cash payments to suppliers (X1010202)”, the “Inven11(X1030101)”, the “Inven12(X1030102)”, and the “Inven13(X1030103)” in the Table 20 respectively.

The three tables of the parent accounts of the “Cash(X101)”, the “Inventory (X103)”, and the “Account payable (X201)” in the Table 18 can be gotten from the three tables of the “Operating activities(X10102)”, the “Inven1 (X10301)”, and the “987654321 (X20101)” in the Table 19 respectively.

The balances of the tables of the “Assets(X1)” and the “Liabilities (X2)” in the Table 17 can be gotten from the three tables of the “Cash(X101)”, the “Inventory (X103)”, and the “Account payable (X201)” in the Table 18 respectively.

The Figure 9 shows the original proof of fifth transaction.

Transaction Original Proof							
Transaction Date: 1/5/2014						General ID	5
Explanation: RR sells \$1,900 inventory to B1 Company (phone number: 123456789) for sales of \$2,530 and receives \$300 cash

Figure 9 Original Proof of Fifth Transaction

The transaction equation is the “Cash (1) + Inventory (1) +Account receivable (1) = Sales (4) + Cost of sales (5)”. Because the “Account receivable” is fourth parent account of writing into 1 class accounts (X1) table, the “Sales” is first parent account of writing into 4 class accounts (X4) table, and the “Cost of sales” is second parent account of writing into 5 class accounts (X5) table, so the transaction’s mathematical equation is the “X101 + X103 + X104 = X401 + X502”.

The account of the X101 has the two-level subaccounts, the account of the X103 has the three-level subaccounts, the accounts of the X104 and X401 have the one-level subaccounts, and the account of the X502 has not any subaccount, so the one-level, the two-level and three-level expanding mathematical sub-equations are the following:

$$\text{One-level sub-equation} \quad X10102 + X10301 + X10401 = X40101 + X502$$

$$\text{Two-level sub-equation} \quad X1010203 + X1030101 + X1030102 + X10401 = X40101 + X502$$

$$\begin{aligned} \text{Three-level sub-equation} \quad & X1010203 + X103010101 + X103010102 + X103010201 + X103010202 \\ & + X10401 = X40101 + X502 \end{aligned}$$

From the Figure 9, the X10102 is the “Operating activities” and X1010203 is the “Cash receipts from customers”; the X10301, X1030101, X1030102, X103010101, X103010102, X103010201, and X103010202 are respectively the “Inven1”, “Inven11”, “Inven12”, “Inven111”, “Inven112”, “Inven121”, and “Inven122”; the X10401 is the “123456789”; the X40101 is the “Xiao Zhou-sales”.

The Same method can be used to calculate the amounts of the parent accounts and their subaccounts.

For recording the transaction, I should create three tables of parent accounts of the “Account receivable”, the “Sales”, and the “Account payable”, and calculated their balances. Meanwhile, I should also create two tables of one-level subaccounts of the “987654321” and the “Xiao Zhou-sales”. The tables of the parent accounts of the “Cash” and the “Inventory” have existed, so I should only update their information, including their subaccounts’ information.

The Table 23 shows the general equation. The Table 24 shows the class accounts of the assets accounts (X1), the revenues accounts (X4), and the expenses accounts (X5). The Table 25 shows the parent accounts of the “Cash”, the “Account receivable”, the “Sales”, and the “Cost of sales”. The Table 26 shows the one-level subaccounts (including the “Operating activities”, the “Inven1”, the “123456789”, and the “Xiao Zhou-sales”), the Table 27

shows the two-level subaccounts (including the “Cash receipts from customers”, the “Inven11”, the “Inven12”, and the “Inven13”), and the Table 28 shows the three-level subaccounts (including the “Inven111”, the “Inven112”, the “Inven121”, and the “Inven122”).

In addition, I should also create a table to record the customers’ information, seeing the Table 29.

Table 23 General equation

GeID	Transaction Date	General Equation	Left Amount	Right Amount	Explanation	Enter Date

Table 29 Customers information

ID	Customer Phone	Customer Name	Address	E-mail	Postal Code	City	State	Country
1	123456789	B1	B2	B3	B4	B5	B6	B7

I write the lowest subaccounts' amounts into their tables respectively and calculate their balances. The four tables of the "Inven111 (X103010101)", "Inven112 (X103010102)", "Inven121 (X103010201)", and "Inven122 (X103010202)" in the Table 28 are the lowest subaccounts (three-level subaccounts) of the parent account of the "Inventory (X103)" respectively, so I write the -\$10*91, -\$4*130, -\$0.8*375, and -\$5*34 into the four tables in the Table 28 respectively. The table of the "Cash receipts from customers (X1010203)" in the Table 27 are the lowest subaccount (two-level subaccount) of the parent account of the "Cash(X101)", so I write the \$300 in

Table 27 respectively. The two tables of the “123456789 (X10401)” and the “Xiao Zhou-sales (X40101)” in the Table 26 are the lowest subaccounts (one-level subaccounts) of the parent accounts of the “Account receivable (X104)” and the “Sales (X401)” respectively, so I write the \$2230 and the \$2530 into the two tables in the Table 26 respectively. The parent account “Cost of sales (X502)” has not any subaccount, so I write the -\$1900 into the table “Cost of sales (X502)” in the Table 25. In addition, I also write the customer’s information into the Table 29.

The two tables of the “Inven11(X1030101)” and the “Inven12(X1030102)” in the Table 27 can be gotten from the four tables of the “Inven111 (X103010101)”, “Inven112 (X103010102)”, “Inven121 (X103010201)”, and “Inven122 (X103010202)” in the Table 28 respectively.

The two tables of the “Operating activities(X10102)” and “Inven1 (X10301)” in the Table 26 can be gotten from the three tables of the “Cash receipts from customers (X1010203)”, the “Inven11(X1030101)”, and the “Inven12(X1030102)” in the Table 27 respectively.

The four tables of the parent accounts of the “Cash(X101)”, the “Inventory (X103)”, the “Account receivable (X104)”, and the “Sales (X401)” in the Table 25 can be gotten from the four tables of the “Operating activities(X10102)”, the “Inven1 (X10301)”, the “123456789 (X10401)”, and the “Xiao Zhou-sales (X40101)” in the Table 26 respectively.

The balances of the three tables of the “Assets(X1)”, the “Revenues (X4)”, and the “Expenses (X5)” in the Table 24 can be gotten from the five tables of the “Cash(X101)”, the “Inventory (X103)”, “Account receivable (X104)”, the “Sales (X401)”, and the “Cost of sales (X502)” in the Table 25 respectively.

On January 28, 2014, RR Company receives \$1,500 cash from B1 Company (phone number: 123456789) with the General ID 5.

The Figure 10 shows the original proof of sixth transaction.

Transaction Original Proof

Figure 10 Original Proof of Sixth Transaction

Here, you must pay attention for sixth transaction. In fact, when I receive the \$1,500 cash, I know that B1 Company pays the cash with the General ID of the related transaction. So, I borrow the Reference box to write the General ID of the related transaction. This General ID can be gotten from the previous transaction original proofs and is the “5”.

Maybe you ask why I do not use the customer’s phone number as a judging standard. Because RR Company

may sell the inventory to this customer for several times and the General ID of a transaction is sole, I must choose the General ID as a judging standard.

From the Figure 10, the Reference box in the row of the “Account Receivable” is the relevant General ID of the “5” which is bold.

The transaction equation is the “Cash (1) + Account receivable (1) = 0” and the transaction’s mathematical equation is the “X101+ X104 = 0”. Because the account of the X101 has the two-level subaccounts and the account of the X104 has one-level subaccounts, the one-level and the two-level expanding mathematical sub-equations are the following:

One-level sub-equation $X10102 + X10401 = 0$

Two-level sub-equation $X1010203 + X10401 = 0$

From the Figure 10, the X10102 is the “Operating activities” and X1010203 is the “Cash receipts from customers”; the X10401 is the “123456789”.

The Same method can be used to calculate the amounts of the parent accounts and their subaccounts.

For recording the transaction, I should just update the related parent accounts and their subaccounts information.

The Table 30 shows the general equation, the Table 31 shows the class accounts of the assets accounts (X1), the Table 32 shows the parent accounts of the “Cash” and the “Account receivable”, the Table 33 shows the one-level subaccounts of the “Operating activities” and the “123456789”, and the Table 34 shows the two-level subaccount “Cash receipts from customers”.

Table 30 General equation

2	123456789	-1500	5	6	2014-1-28	730

Table 34 Two-level subaccount

Cash receipts from customers (X1010203) << Parent account: Cash (X101)

ID	MultiName	Amount	Ref	GeID	Transaction Date	Balance
1	Cash receipts from customers< Operating activities	300		5	2014-1-5	300
2	Cash receipts from customers< Operating activities	1500	5	6	2014-1-28	1800

I write the lowest subaccounts' amounts into their tables respectively and calculate their balances. The table of the "Cash receipts from customers (X1010203)" in the Table 34 is the lowest subaccount (two-level subaccount) of the parent account of the "Cash(X101)", so I write the \$1500 into the table of the "Cash receipts from customers (X1010203)" in the Table 34. The table of the "123456789 (X10401)" is the lowest subaccount (one-level subaccount) of the parent account "Account receivable (X104)" in the Table 33, so I write the -\$1500 and the related GeID "5" into the table of the "123456789 (X10401)" in the Table 33.

The table of the "Operating activities(X10102)" in the Table 33 can be gotten from the table of the "Cash receipts from customers (X1010203)" in the Table 34.

The two tables of the parent accounts of the "Cash(X101)" and the "Account receivable (X104)" in the Table 32 can be gotten from the two tables of the "Operating activities (X10102)" and the "123456789 (X10401)" in the Table 33 respectively.

The balances of the table of the "Assets(X1)" in the Table 31 can be gotten from the two tables of the

“Cash(X101)” and the “Account receivable (X104)” in the Table 32 respectively.

In addition, for getting the financial statements and checking information easily, I also create the Table 35 (by the order of the row), the Table 36, and the Table 37 after recording the sixth transaction.

Table 35 Reference

18	N	Cost of sales	5	5

So far, I have recorded 6 transactions' data. For checking whether the recording data is reliable and correct, I will do the following three calculations.

- Check whether the dynamic accounting equation is equal.

From the Table 30, when the 6 general equations are added together, I get the left amount \$13583 and the right amount \$13583 of the dynamic accounting equation on February 28, 2014. These two amounts are equal.

- Check whether the sum of all assets accounts' balances is equal to the sum of all liabilities accounts, all equity accounts, all incomes accounts, and all expenses accounts' balances.

1. For all assets accounts

From the Table 32, I get that the parent accounts "Cash" is \$10,890 and the "Account receivable" is \$730.

From the table 25, I get that the parent account “Inventory” is \$1,770.

From the Table 8, I get that the parent account “Supplies” is \$193.

So, the sum of the assets accounts is \$13,583 ($= \$10,890 + \$730 + \$1,770 + \193).

Of course, I can also get that the sum of the assets accounts is \$13,583 from the table “Assets (X1)” in the Table 31.

2. For all liabilities accounts

From the Table 18, I get that the parent account “Account payable” is \$3,000.

So, the total amount of the liabilities accounts is \$3,000.

Of course, I can also get that the total amount of the liabilities accounts is \$3,000 from the table “Liabilities(X2)” in the Table 17.

3. For all shareholders’ equity accounts

From the Table 3, I get that the parent account “Share capital” is \$10,000.

So, the total amount of the shareholders’ equity is \$10,000.

Of course, I can also get that the total amount of the shareholders’ equity accounts is \$10,000 from the table “Shareholders’ equity(X3)” in the Table 2.

4. For all revenues accounts

From the Table 25, I get that the parent account “Sales” is \$2,530.

So, the total amount of the revenues accounts is \$2,530.

Of course, I can also get that the total amount of the revenues accounts is \$2,530 from the table “Revenues(X4)” in the Table 24.

5. For all expenses accounts

From the Table 25, I get that the parent account “Cost of sales” is -\$1,900.

From the Table 13, I get that the parent account “Travelling expenses” is -\$47.

So, the total amount of the expenses accounts is -\$1,947 ($= -\$1,900 - \47).

Of course, I can also get that the total amount of the expenses accounts is -\$1,947 from the table “Expenses(X5)” in the Table 24.

The sum of all assets accounts is \$13,583. The sum of all liabilities accounts, all shareholders’ equity accounts, all revenues accounts, and all expenses accounts is \$13,583 ($= \$3,000 + \$10,000 + \$2,530 - \$1,947$).

These two sum amounts are equal. They are \$13,583.

- After the previous two steps are correct, I check whether the left (or right) amount of the dynamic accounting equation is equal to the sum of all assets accounts’ balances (or the sum of all liabilities, all equity accounts, all incomes accounts, and all expenses accounts’ balances).

Obviously, the requirement is satisfied.

The above three requirements are satisfied, so the mathematical accounting model is reliable and correct.

Maybe, you asked that the mathematical accounting model is so complicated. Yes. If a business company has many subaccounts, it is very difficult to record these transactions.

However, we are lucky. With development of computer and database technology, most work in the mathematical accounting model can be done by the computer. So, it is very easy to record these transactions by using of the MathAccounting software which is based on this mathematical accounting model. The only parent accounts are created in the database and all subaccounts will be gotten by using of the database query in the MathAccounting software, so what you must know is just to fill in the original proof of a transaction. It is easy?

2. Introduction of MathAccounting Software

Based on above mathematical accounting model, I have developed the MathAccounting Software by using the Visual Basic 2012 language and the SQL Server 2012 database in February 2015.

The MathAccounting software has little limitation, just like the equation of the “ $1 + 1 = 2$ ” which may be that one person plus one person equals two persons or one apple plus one apple equals two apples, so the MathAccounting software can be used by all economic entities regardless of their size, nature of business, or form of business organization without any altering.

The MathAccounting software has four function models: Transactions, Reports, Backup/Restore, and Maintenances. I suggest that the names of all accounts and subaccounts are only consisted of English alphabets, number, colon, and blank space when you enter these names. I will introduce the four function model below.

For this version of MathAccounting software, there are some limitations (from theory, the numbers are infinite):

- The maximum number of entries in each transaction is eight, which means that there are maximum eight terms (items) in a sub-equation (general equation).
- The maximum number of customers or suppliers is twenty.
- The maximum level number of every parent account is three levels. Its form in the “MultiSubaccount Name” box is defined as the “three-level subaccount<two-level subaccount<one-level subaccount”.

After executing the software, I can get the Figure 11.

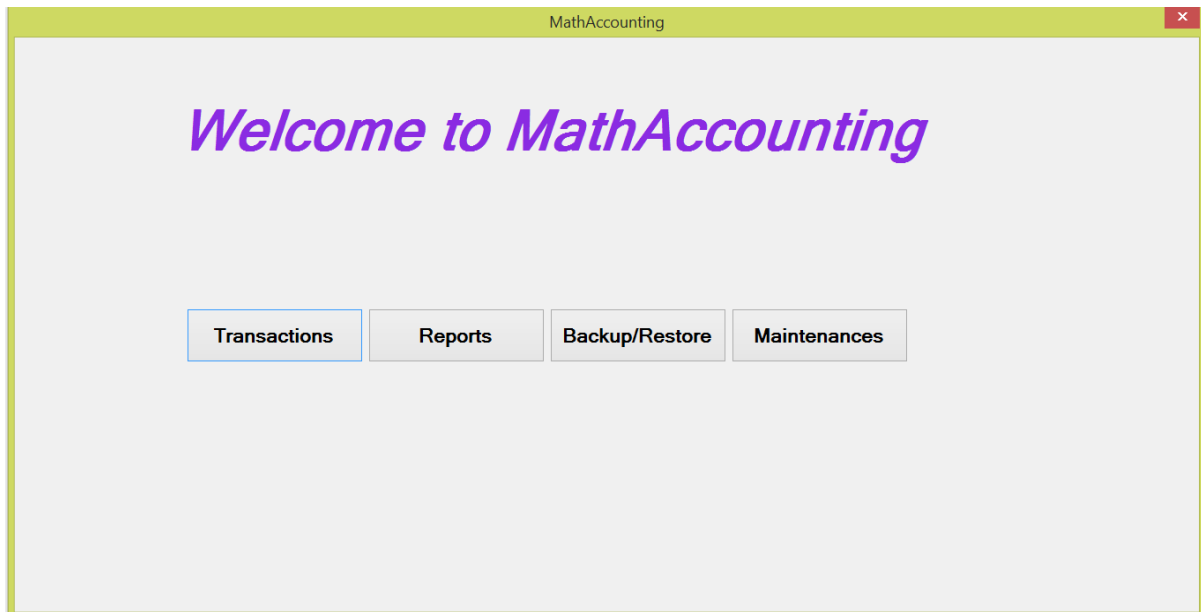

Figure 11 MathAccounting Interface

There are four boxes of the functions in the Figure 11. The Transactions box is to enter each transaction and to design your income statements, balance sheet, cash flows and so on. The Reports box is to get all information about all parent accounts, subaccounts, and company performance. The Backup/Restore box is to backup and restore database. The Maintenances box is to delete the useless accounts or alter some mistakes. However, I must emphasize such a fact that entering or altering of every amount can be only completed by use of entering a transaction in the Transaction function model.

2.1 Transactions Function Model

After clicking the Transactions box, you can get the Figure 12.

MathAccounting

Continue

Figure 12 Transaction Entering Interface

There are three rows of boxes in the Figure 12, but you can only see the two rows of boxes now. The other row of box or boxes can be shown in satisfying special requirement, such as a new account being entered.

There are six boxes in the first row.

- Trans Date of box: enter transaction date;
- Explanation of box: enter transaction's explanation including any invoice number;
- Class of box: enter only one number of the one to five;
- Account Name of box: enter parent account name which will appear in the income statement and the balance sheet;
- Amount of box: enter the amount. Increasing equity amount is the “+”(you can omit it); decreasing equity amount is the “-”;
- MultiSubaccount Name of box: enter a multi-subaccount name. Its form is the “three-level subaccount<two-level subaccount<one-level subaccount”.

There are two boxes in third row.

- Big box: it only shows you how many entries you have entered in a transaction. If the sub-equation is equal, a general equation will appear under the dynamic accounting equation, which means that a transaction has entered into database completely and correctly. Meanwhile, the contents in the boxes of the first and second rows will disappear to be ready for a new transaction.
- Small box: click it to continue current transaction or begin a new transaction.

The second row boxes' functions will be introduced later while they are enabled.

Now, let me try to enter following five transactions in the mathematical accounting model.

- Investment by owners. On January 2, 2014, Ping Wang, Hua Li and Mike Newsome decide to open a RR trade business, so Ping Wang invests \$4,000 cash in business, and Hua Li and Mike Newsome each invest \$3,000 cash in business.

The sub-equation can be written as following:

$$\begin{aligned} \text{Cash (1): } 10000 &= \text{Share capital (3): } 4000 + \text{Share capital (3): } 3000 \\ &+ \text{Share capital (3): } 3000 \end{aligned}$$

The Table 36 shows the original proof of the transaction again. After I enter the “Cash” into Account Name box, the Subtotal and Reference boxes are enabled. The main functions of these two boxes are to build the balance sheet and income statements. In this transaction, I enter the “Current assets, 103” into the Subtotal Name box and the “104” into the Reference box, which shows in the Figure 13.

Figure 14 Entered Cash Interface

Because the “Share capital” account has three one-level subaccounts, I must enter these one-level subaccounts separately. The Figure 15, the Figure 16, and the Figure 17 show the three entries respectively.

From the Figure 15, the Subtotal Name box and the Reference box keep enabled after entering “Share capital” into the Account Name box because the “Share capital” is a new account. I enter the “Owners’ capital, 303” and the “304” into the Subtotal Name box and the Reference box” respectively.

From the Figure 16, the Subtotal Name box and Reference box are not enabled after entering “Share capital” into the Account Name box because the “Share capital” account has existed in the database.

From the Figure 17, the Subtotal Name box and Reference box are not enabled too after entering “Share capital” into the Account Name box because of the same reason. A general equation appears under the dynamic accounting equation after clicking the Continue box and the cursor is focus on the Trans date box, which actually means that a transaction has completed correctly and the entering information has saved into the database.

Figure 19 Entering Supplies Account

From the Figure 19, the “Supplies” account is a new account, so I enter row number 106 into the Reference box. Of course, you may enter number 105 or 108 if you like. There is a letter of the “n” in the Multisubaccount Name box, which means that the “Supplies” account has not any subaccount.

A general equation appears under the dynamic accounting equation in the Figure 19, which means that the transaction has entered into the database correctly.

- Cash payments for Hua Li's taxi fee expense. On same day, Hua Li takes taxi to carry on the supplies for \$47 cash.

The sub-equation is

Cash (1): -47 = - Travelling expenses (5): 47

The Table 38 shows the original proof of the third transaction again.

Table 38 Original Proof of Third Transaction

The “Travelling expenses” account is a new account, so the Subtotal Name box must be entered. The “Travelling expenses” account must be under the row of the “Gross Margin” whose number is 451, so the row number of the “Travelling expenses” account should be greater than number 451. If the Subtotal name is the “Operating and Administrative expenses, 453”, the number in the Reference box should obviously be 454 (or 456 if you like), seeing the Figure 20.

The “Travelling expenses” account has the two-level subaccounts, such as the “Different person< Purchase department”, the “Different person< Office department”, and the “Different person< Sales department”, so its entering form should be the “Hua Li <Purchase department”. However, if there are any other accounts with the two-level subaccounts which are also divided according to the different departments, then I must give a signal to distinguish them. Later, you will see an example of the other expenses account. So, its entering form is the “Hua Li-travelling< Purchase department-travelling”.

Figure 20 Entering Cash and Travelling expenses accounts

- Purchase of inventory for some cash and other on credit. On January 5, 2014, RR receives \$3,670 inventory for \$670 cash and other on credit from A1 company (phone number: 987654321).

The sub-equation is

$$\text{Cash (1): } -670 + \text{Inventory (1): } 3670 = \text{Account payable (2): } 3000$$

The cash is paid to a supplier, but the payments still belongs to the “Operating activities”. The

Multisubaccount Name box's form is the "Cash payments to suppliers< Operating activities".

The "Inventory" account belongs to the "Current assets" of the subtotal name too and it has the four three-level subaccounts and the one two-level subaccount (it may have other subaccounts later), seeing the Table 39, so I must separately enter these subaccounts, just like previous "Share capital" account.

For understanding the relationship of these subaccounts easily, I use mathematical language to describe them. In real environment, you can use actual names to replace these logical names.

After entering the "Inventory" account, I get the Figure 21.

Figure 21 Entering Inventory Account

After entering the “Account payable” account, I get the Figure 22. From the Figure 22, there is a big

change which is that the other boxes of the second row are enabled now. These boxes are used to enter customers' or suppliers' information. Here is a supplier. The "Account payable" account is a new account, and its subtotal name should be the Current liabilities. I give the row number of the subtotal name is 203, so the reference box is 204. In addition, a general equation appears under the dynamic accounting equation, which means the transaction is completed correctly.

Figure 22 Entering Account Payable

- Xiao Zhou sales for some cash and other on credit. On January 5, 2014, RR sells \$1,900 inventory for sales of \$2,530 to B1 Company (phone number: 123456789), and receives cash 300.

The sub-equation is

Cash (1): 300 + Inventory (1): -1900 + Account receivable (1): 2230 = Sales (4): 2530

-Cost of sales (5): 1900

The cash is received from a customer, so the Multisubaccount Name box is entered by the “Cash receipts from customers< Operating activities”, which is different from the previous cash entry. Its two-level subaccount is the “Cash receipts from customers”, seeing the Table 40.

The entries of the inventory are similar as previous inventory’s entries, but please pay attentions of the fact that their amounts all should be negative because they are sold and the amounts decrease.

The entry of the “Account receivable” is similar as previous “Account payable” entry. Its subtotal name is the “Current assets,103” and its row number is 110.

After entering the “Sales” account and clicking the Continue Box, I get the Figure 23.

Figure 23 an Information Box Appearing

From the Figure 23, an information box appears. It tells me that 7 entries having entered and the amounts of the left and the right of the sub-equation, so I must enter correct amount in the last entry (eighth entry) to make the two sides of the sub-equation equal.

A transaction has only a maximum number of eight entries in this version of the MathAccountion

software. From theory, a transaction can have infinite entries. I will increase the entries' number of a transaction in later version of the MathAccounting software.

Entering the "Cost of sales" account gets the Figure 24. From the Figure 24, the "Cost of sales" account is a new account and should appear under the Subtotal name of the "Revenues" (its row number is 403), so the row number of the Subtotal name should be 431 and the reference box's number be 432. In addition, a general equation appears under the dynamic accounting equation, which means that the transaction is completed correctly.

Figure 24 Entering Cost of Sales Account

Before entering more transactions, let us take a rest and look at the other three function models: Reports, Backup/Restore, and Maintenances.

2.2 Reports Function Model

The Reports function model does not check anything and only shows you all information you have entered into the database in the Transactions function model. After calculating or categorizing behind the screen, the information is shown by the tables.

Executing the MathAccounting software and clicking the Reports Box, I get the Figure 25. There are 18 small boxes on the right of the screen, which means that you can get 18 different information tables. When I click a box, I may be required to enter simple information, such as an account name. Entering the capital case letters or the lower case letters does not matter.

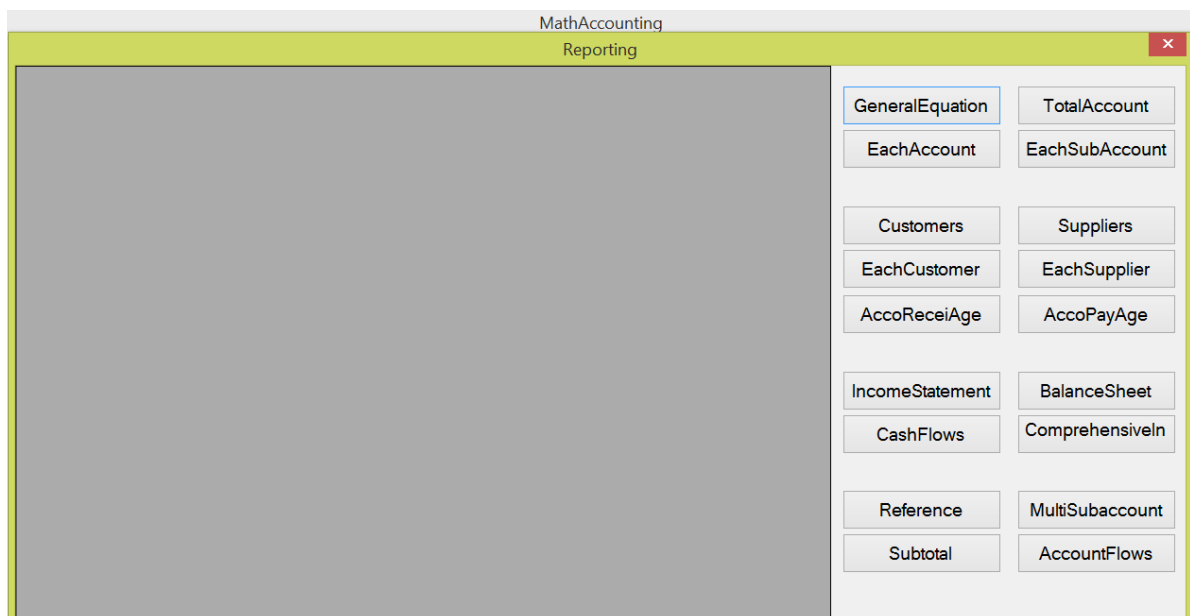

Figure 25 Reports Function Model Interface

Clicking the GeneralEquation box, I get the Figure 26, which shows me five general equations or sub-equations and other information I entered previously. The General ID is a very useful parameter which is often quoted or referenced by other processes or the tables except for recording total number of the transactions I have entered. Scrolling rightly, I can get more information.

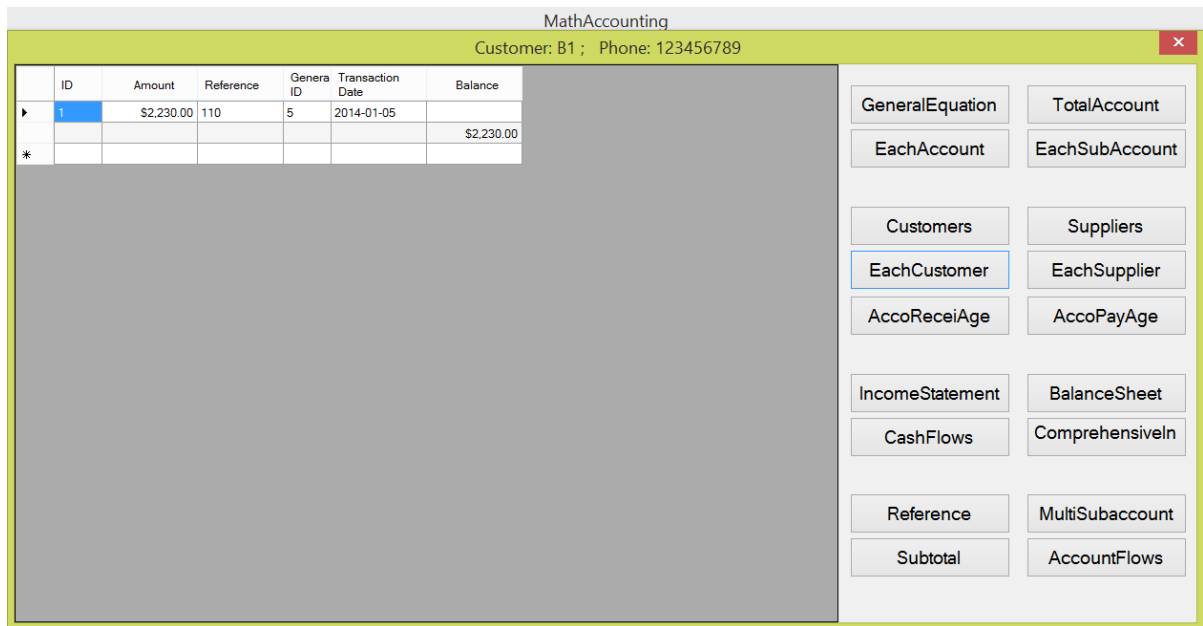

Figure 32 Account receivable for Customer B1

The AccoReceiAge box shows me how many customers and their balance there are in a special period, such as 30 days (here is account receivable age). After clicking the AccoReceiAge box and entering a period of 0-30, I get the Figure 33 which shows me that there are not any number in the second table. Why? In fact, I have only entered one customer, and its account receivable age is greater than the 30 days now.

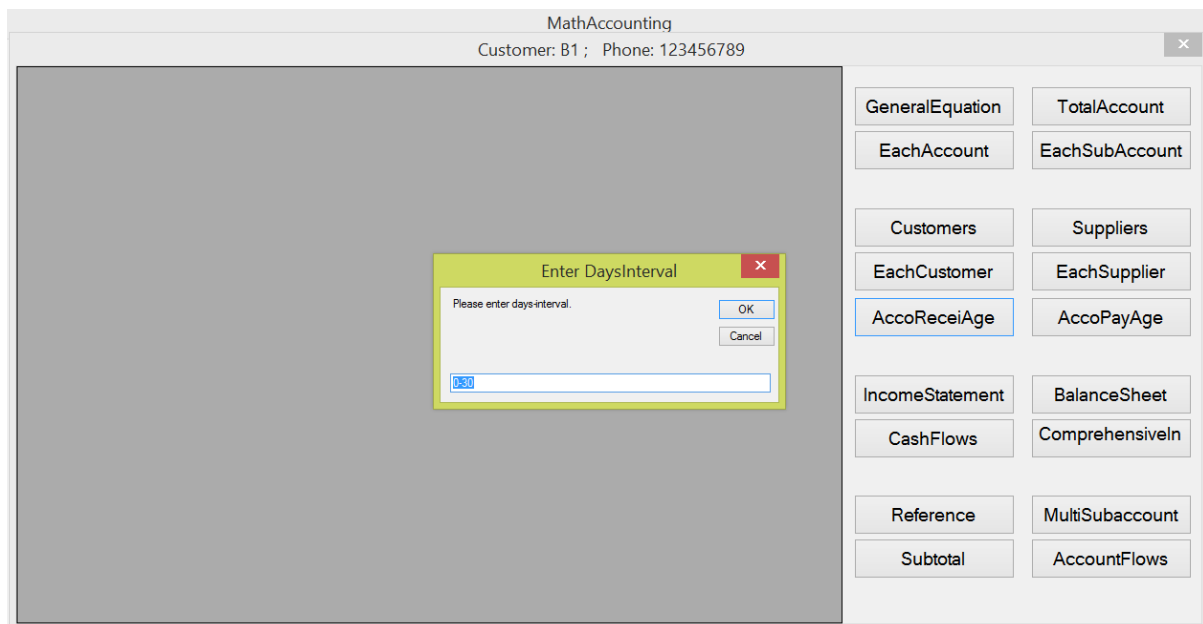

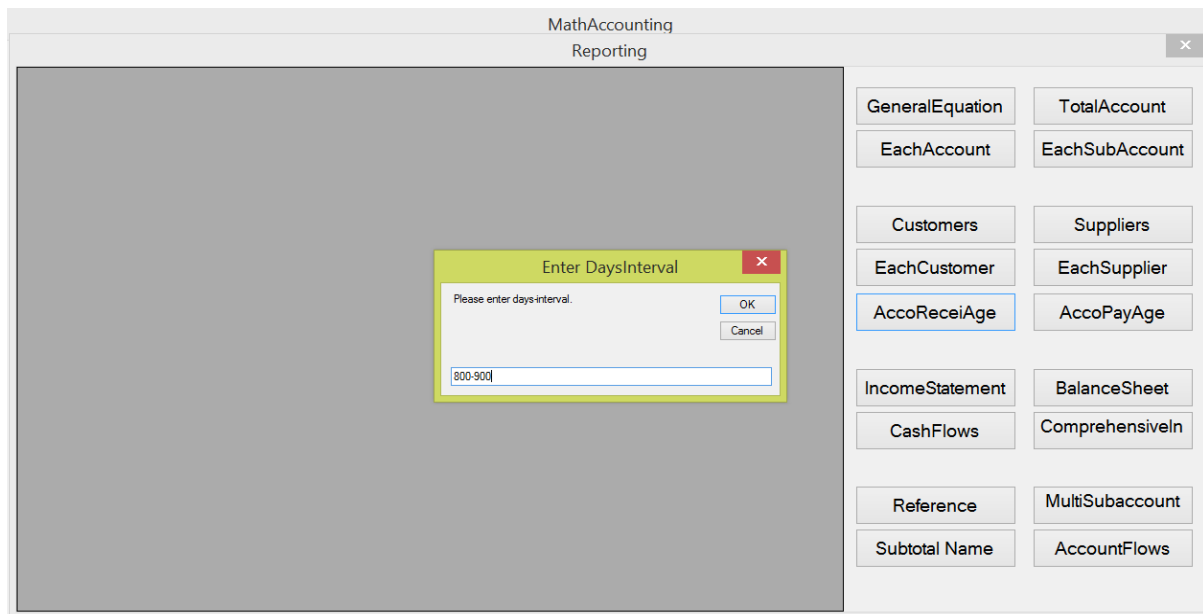

Figure 33 Every Customer's Account Receivable Age in period 0-30 days

Trying to enter a period of 800-900, I get the Figure 34 which tells me that there is one customer, its ages of day are 804 days, and its balance is \$2,230.

Similar for the suppliers, I can get the information for every supplier.

MathAccounting Account Receivable Age of Every Customer							
	General ID	Amount	Day	Customer Name	Phone	Transaction Date	Balance
▶	5	\$2,230.00	804	B1	123456789	2014-01-05	
*							\$2,230.00

Figure 34 Every Customer's Account Receivable Age in period 800-900 days

The IncomeStatement, BalanceSheet, CashFlows, and ComprehensiveIncomeStatement boxes will be introduced later after entering more transactions. However, you can try to click them now.

The Reference, MultiSubaccount, and Subtotal Name boxes are the copies of the tables in the database which I entered the data into. You can try to click them to get the information. I am interested in the AccountFlows box.

After clicking this box, I get a table which is similar as the cash flows statement. When an account has more than three one-level subaccounts, the table only shows the top three one-level subaccounts by their sum of amounts. Clicking the AccountFlows box and entering the “inventory”, I get the Figure 35 which tells me that there is only one one-level subaccount: Inven1. The beginning balance of the inventory is 0 because the company is a new company. The net change in the inventory account is \$1,770 due to the change of the one-level subaccount of the Inven1. So, the ending balance of the inventory is also \$1,770.

2.3 Backup/Restore Function Model

The reliability and correctness of recording data in the accounting are very important, so I pay more attention to this subject in designing the MathAccounting software. There are three steps to guarantee the recording data reliable and correct.

- Check whether the dynamic accounting equation is equal.
- Check whether the sum of all assets accounts' balances is equal to the sum of all liabilities accounts, all

equity accounts, all incomes accounts, and all expenses accounts' balances.

- After the previous two steps are correct, I check whether the left (or right) amount of the dynamic accounting equation is equal to the sum of all assets accounts' balances (or the sum of all liabilities, all equity accounts, all incomes accounts, and all expenses accounts' balances).

After the above three conditions are all satisfied, the MathAccounting software can continue the next transaction's entries.

When I turn on computer to readily enter the new transactions, the computer automatically checks the three steps, which guarantees that the new transactions are entered into the reliable and correct database. If one of them is wrong, the computer will tell me that I must restore the previous day's database backup.

After I enter one day's transactions (or every transaction) and begin to do the backup of the database, the computer automatically also checks the three steps, which guarantees the backup of the database is reliable and correct. If one of them is wrong, I cannot do the backup of the just renewed database. I must find the mistakes during today's entries and correct the mistakes or I should restore the previous day's backup and begin today's transactions (or every transaction) again. Do not worry about that. The situation seldom appears because every entry of the transactions is required to check the sub-equation. Maybe, the breakdown of the computer can cause the trouble during entering a transaction.

Clicking the Backup/Restore box, I get the Figure 36 which has six boxes. The three boxes of the first row are every day backup, every month backup, and one year backup before beginning the new fiscal year.

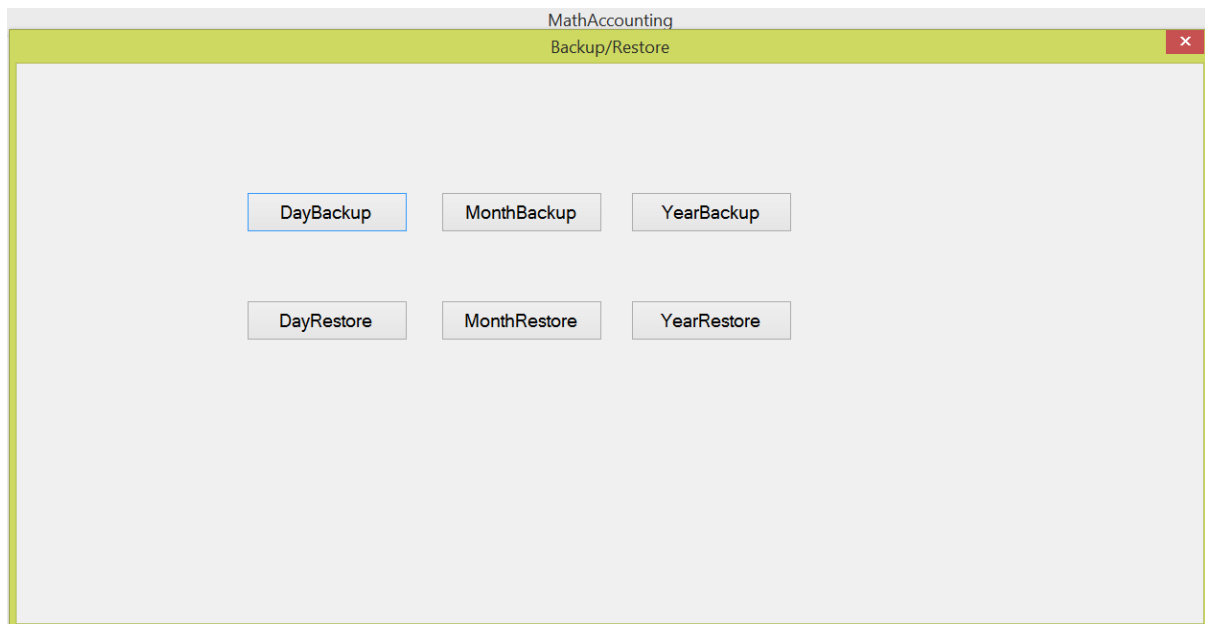

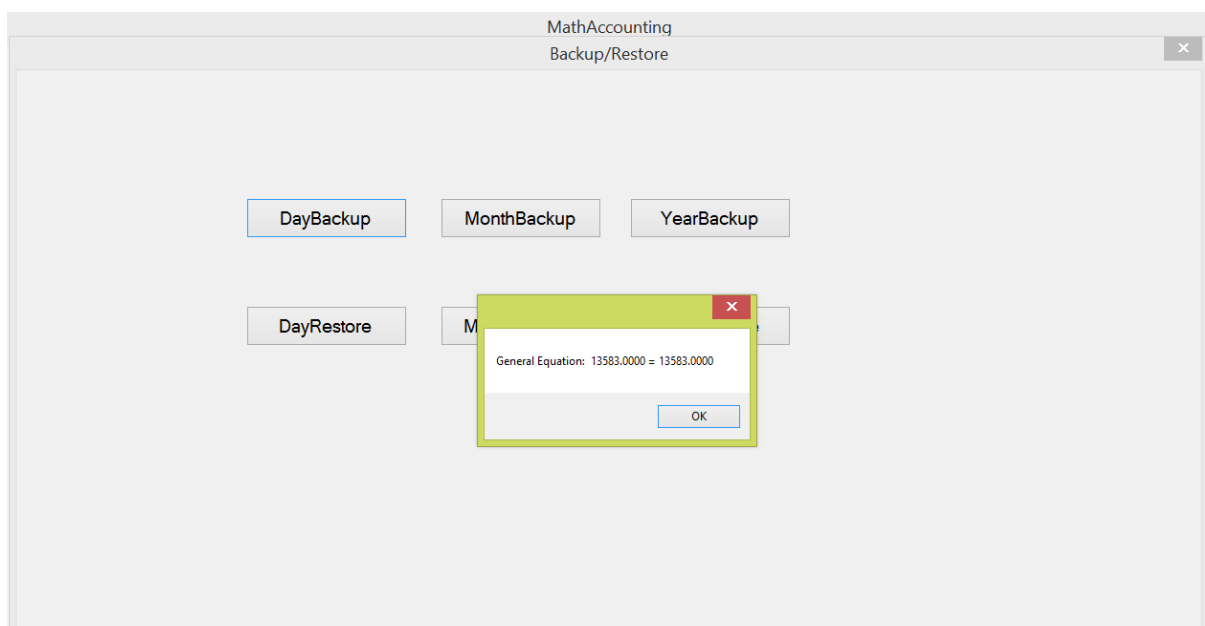

Figure 36 Backup/Restore Interface

The DayBackup means that the today's entries of all transactions are added up to the existing backup database.

Of course, I can also use the DayBackup box to do every transaction's backup. After clicking the DayBackup box and the OK box, I get the Figure 37. Clicking the OK box again, I have completed the DayBackup.

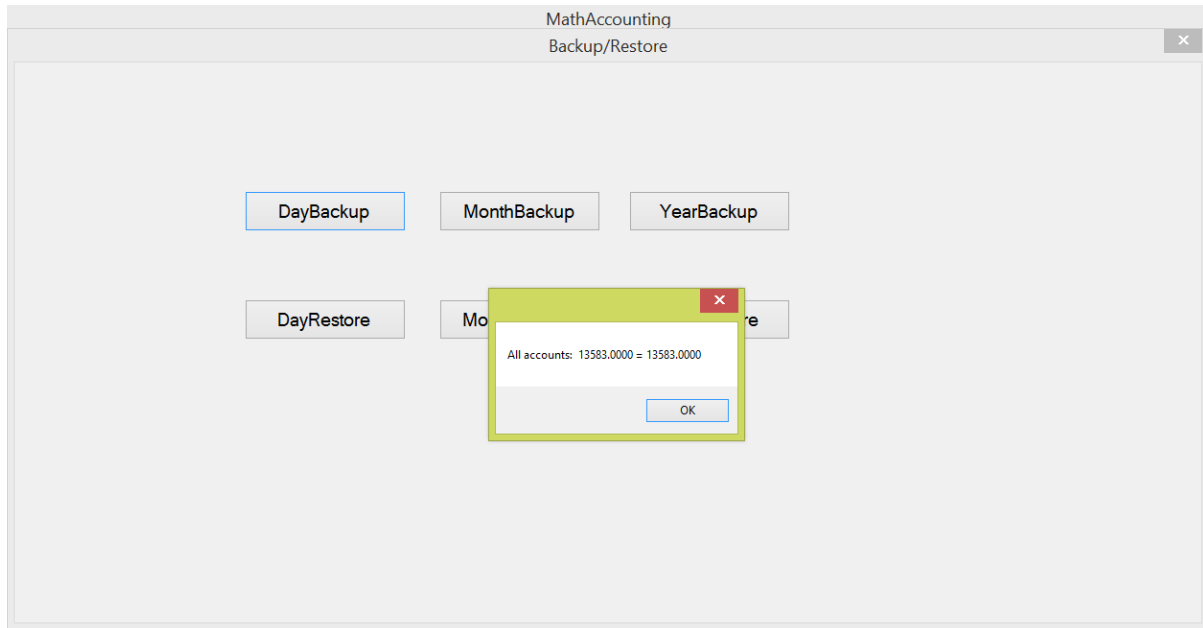

Figure 37 Day Backup Process

The MonthBackup is same as the DayBack.

The YearBackup is different. You can do the YearBackup only after you complete the income statement.

The three boxes of the second row in the Figure 36 are every day restore, every month restore, and every year restore respectively. Clicking the DayRestore box, I get the Figure 38 which tells me some information about the last transaction. After clicking the OK box, I complete the restore of the database and can continue to enter the new transactions since the last transaction.

The MonthRestore and the YearRestore are same as the DayBackup.

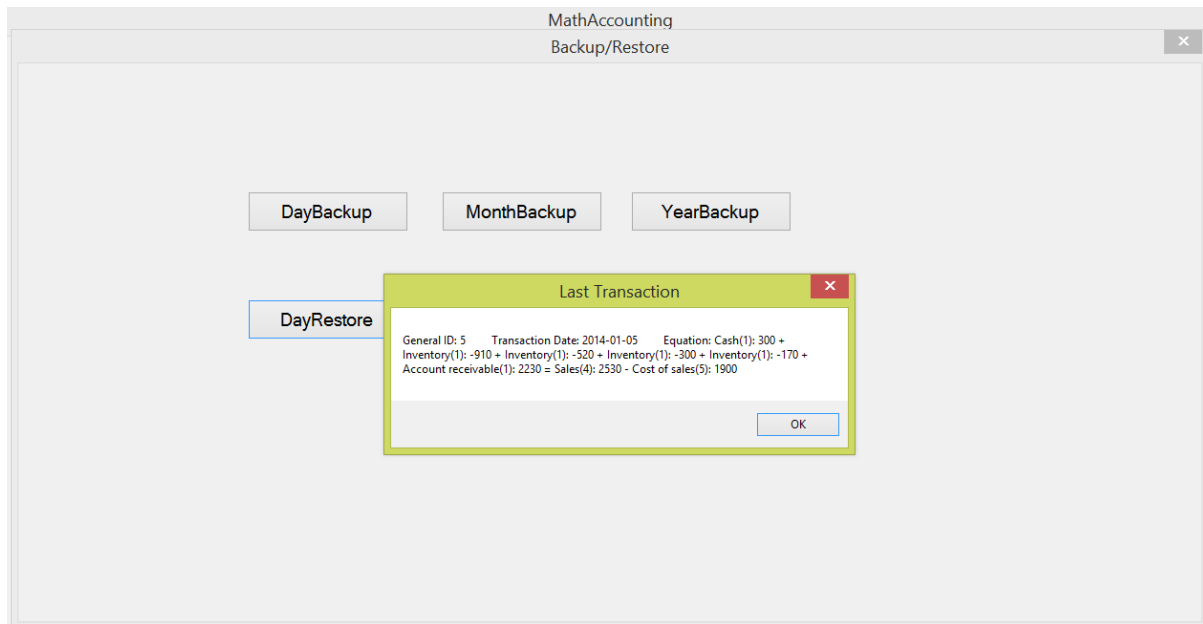

Figure 38 Day Restore Process

2.4 Maintenances Function Model

After clicking the Maintenances box, I get the Figure 39. The maintenances function model is mainly used to alter account names, multisubaccount name, and subtotal name, and delete the useless account names.

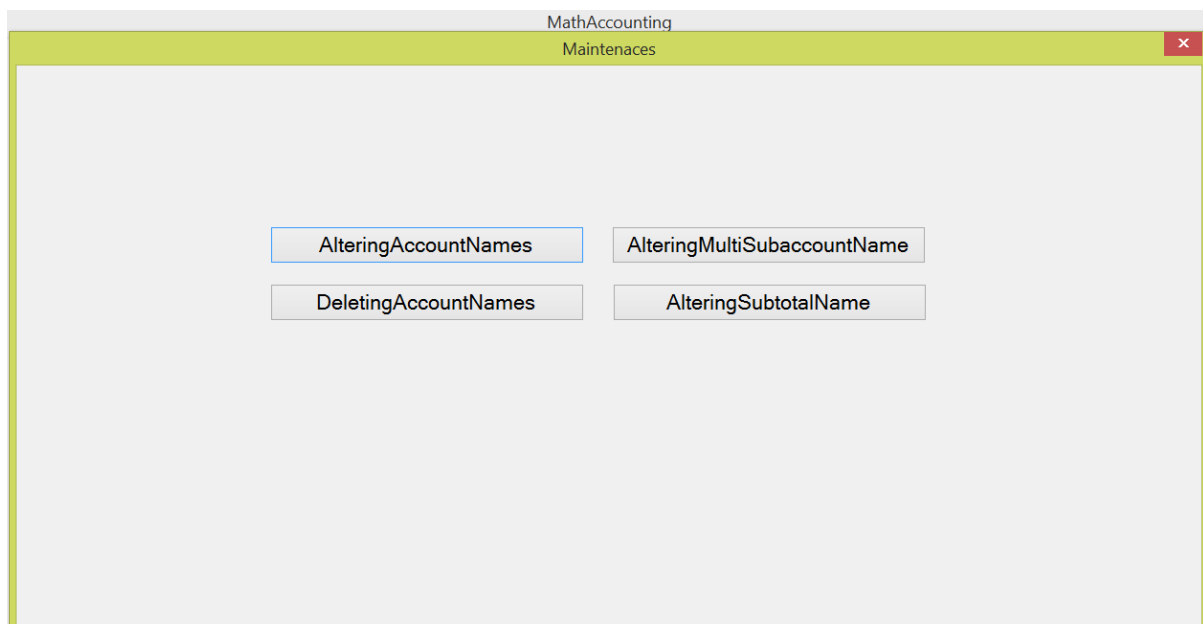

Figure 39 Maintenances Function Model Interface

If I want to change the “Supplies” account to the “Office supplies” account, then I can click the AlteringAccountName box to do that. However, if I want to put the new account of the “Office supplies” under the account of the “Inventory” at same time (now the “Supplies” account is above the “Inventory” account), then I can only do that by use of clicking the DeletingAccountName box. First, I delete the account of the “Supplies”, and then I can build a new account of “Office supplies” which is under the account of the “Inventory” by entering correct row number.

After clicking the AlteringAccountName box, entering old account name, pressing the OK box, and entering the new account name, I get the Figure 40. Simply pressing the OK box again, I have changed the “Supplies” account to the “Office supplies” account.

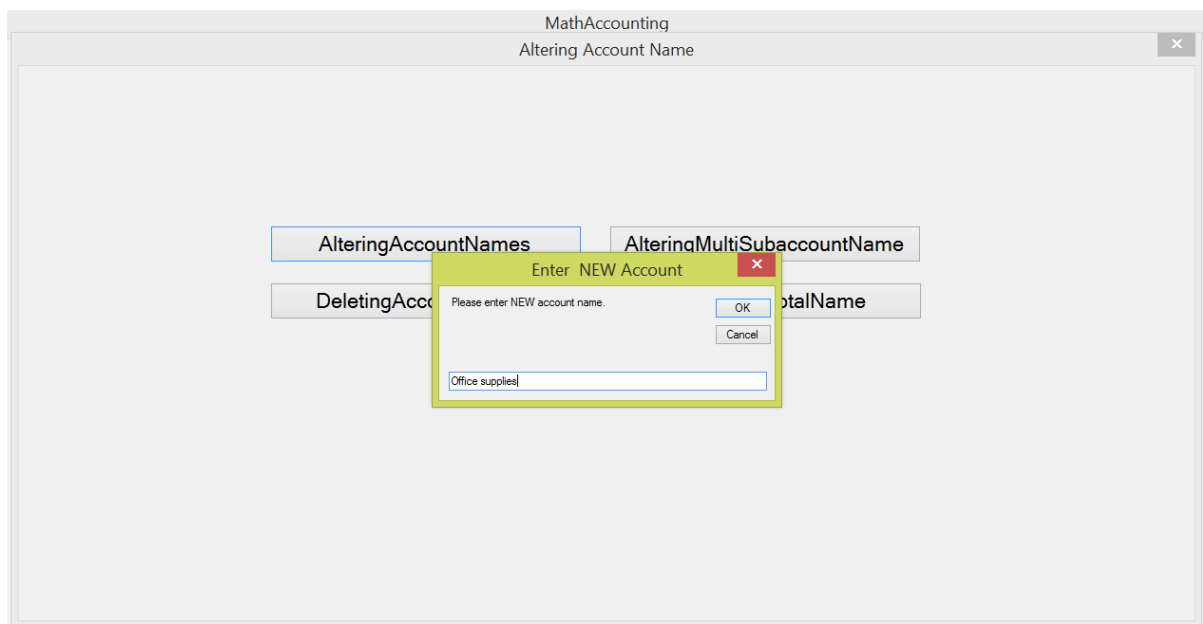

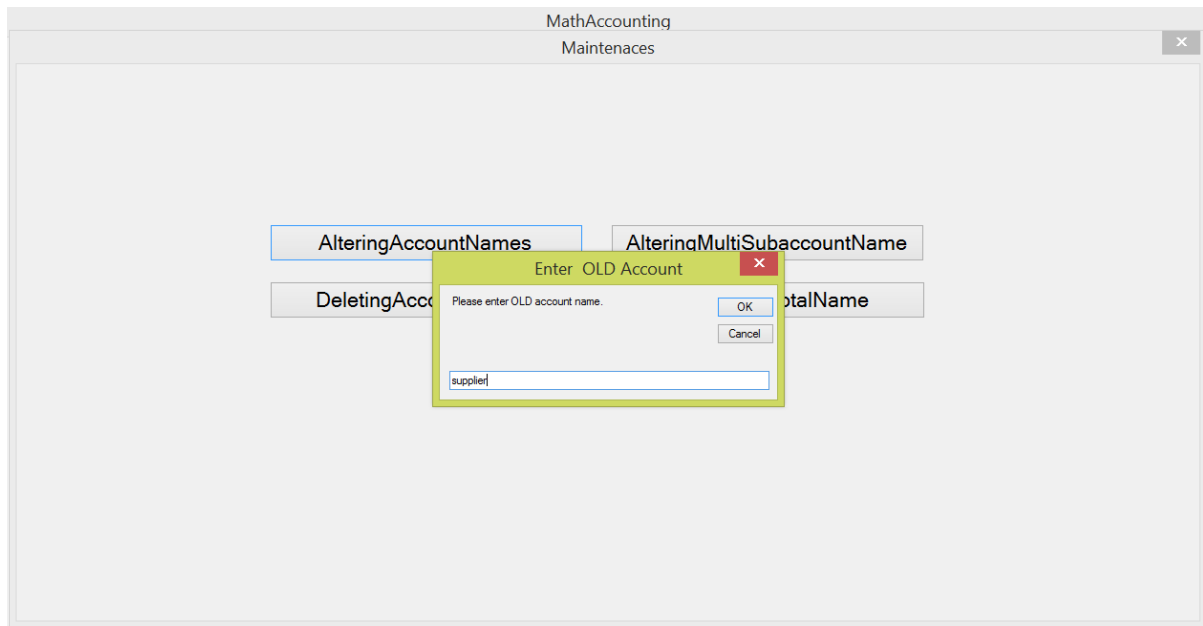

Figure 40 Altering Account Name

If there is a mistake that the Inven13 does not belong to the Inven1 and belongs to the Inven2 in the previous entries, then I must replace the multisubaccount name of the “Inven13<Inven1” with the multisubaccount name of the “Inven21<Inven2”. Clicking the AlteringMultiSubaccountName box, entering old multisubaccount name, pressing OK box, and entering the new multisubaccount name, I get the Figure 41. Simply pressing the OK box again, I have changed the “Inven13<Inven1” to the “Inven21<Inven2”.

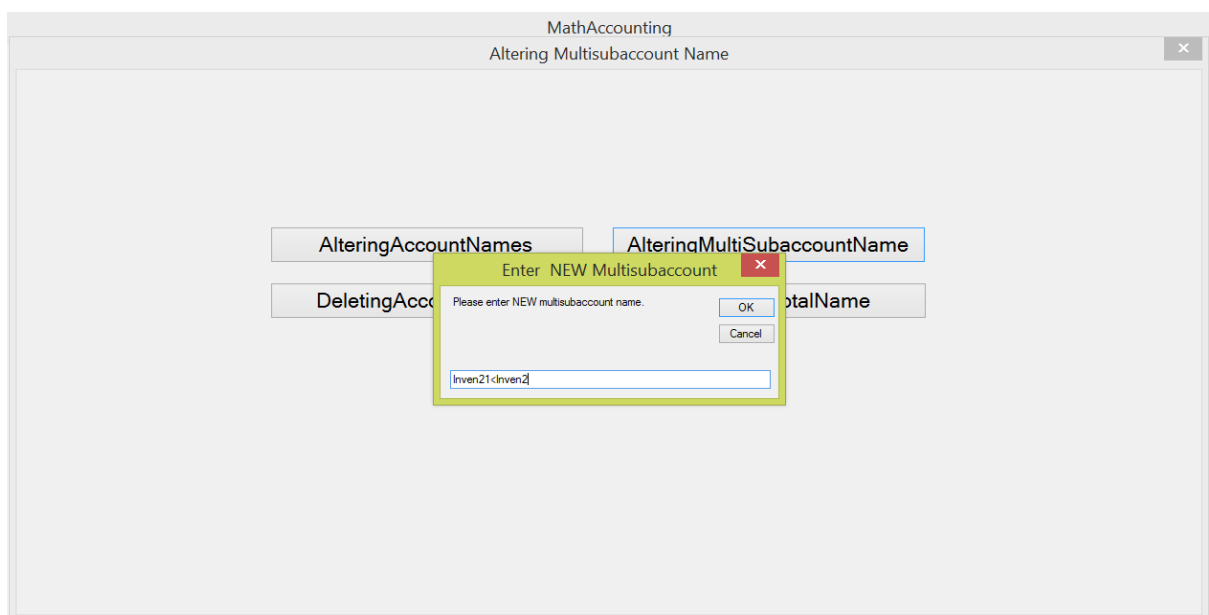

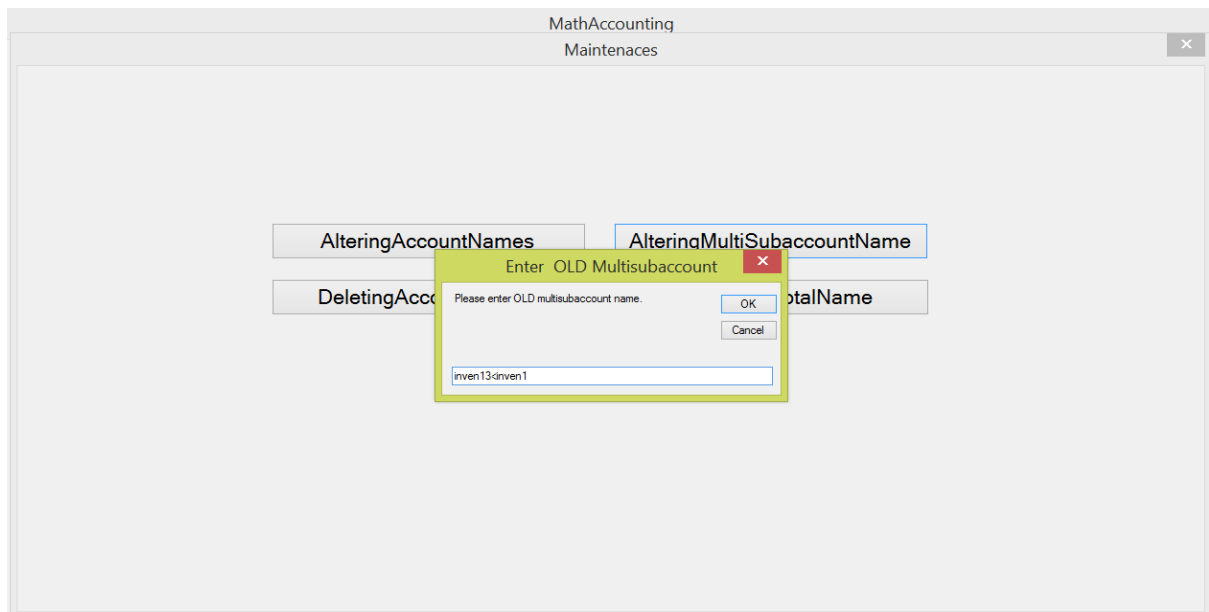

Figure 41 Altering a Multisubaccount Name

Similar as the MultiSubaccount name, I can change the subtotal name by clicking the Subtotal Name box.

However, I must emphasize that the row number of the subtotal name is not allowed to change because there may be many accounts under this subtotal name.

If the account of the “Office supplies” is useless, I can delete the account by clicking the DeletingAccountName.

When I enter the account name and press the OK box, I get warning information, seeing the Figure 42.

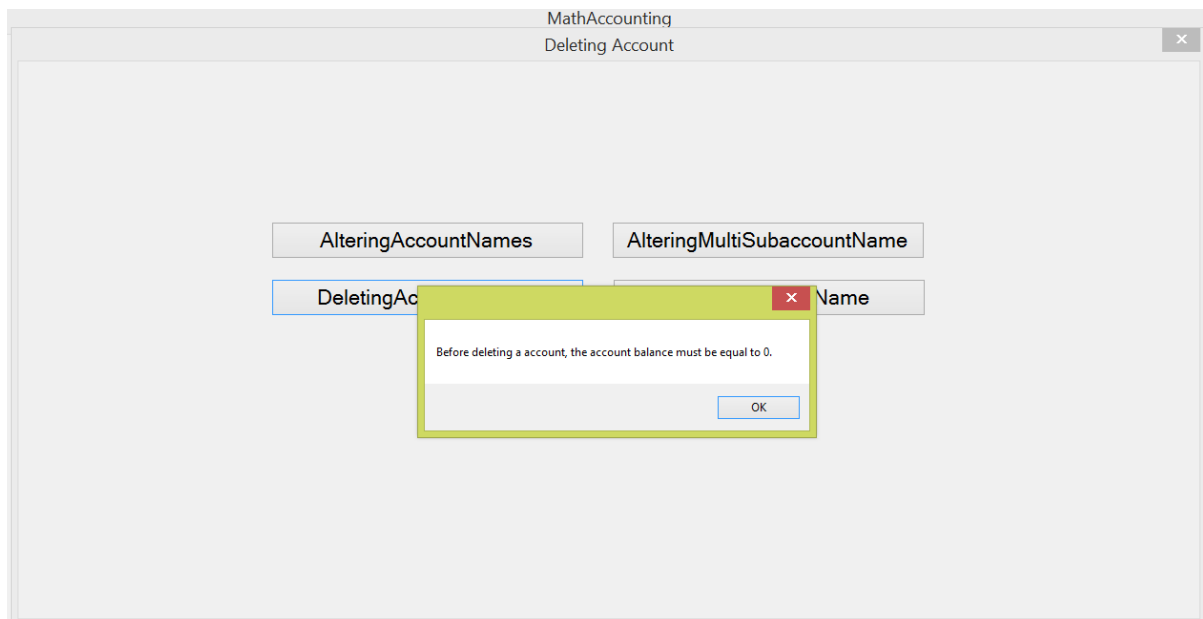

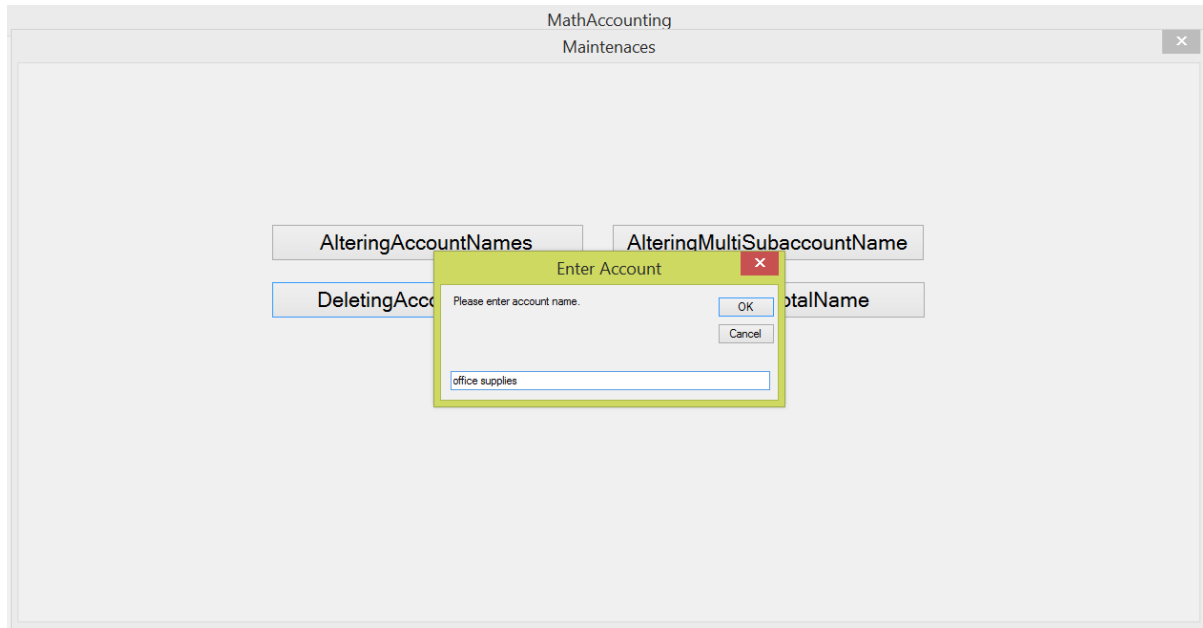

Figure 42 Warning before Deleting an Account

The account balance must be 0, so I enter the following transaction before deleting the “Office supplies” account.

Office supplies (1) -193 = - Office expenses (5) 193

Clicking the DeletingAccountName box again and press the OK box, I have deleted the account of the “Office supplies”.

Now I can check these changes. Closing the Maintenances function model and opening the Reports function model. After respectively clicking the TotalAccount box for assets and expenses, and the Multisubaccount Name box, I can get the Figure 43. From the Figure 43, these changes have been done. The account of the “Office supplies” disappears from the asset table, and the account of the “Office expenses” appears in expenses table.

The “Inven21<Inven2” has replaced the “Inven13<Inven1”.

That is all of the MathAccounting software. It is easy?

Figure 43 Check These Changes

In addition, the functions of the human resource and inventory management have been developed in the MathAccounting Software. If all subaccounts (including one-level subaccounts of factories, two-level subaccounts of departments, and three-level subaccounts of employees' ID) of the parent account "Salary Expenses" and all one-level subaccounts (Net Payroll Payable, tax Payable, and so on) of the parent account "Salary Payable" are designed to have 9,999 subaccounts, then human resource department can also use the MathAccounting Software to deal with work of the human resource management. The inventory management is similar to the human resource management. However, while entering inventory amount, its form is the "unit price * number".

In the two function models, the "cash" account cannot be used. Instead, the account of the "something payable" is used.

3. Sample of an accounting fiscal year

Last thing is to enter more transactions to complete an accounting fiscal year. During entering these transactions, I will introduce some new contents. Finally, I will build the five tables: Income Statement, Balance Sheet, Cash Flows Statement, Comprehensive Income Statement, and Account Flows Statement.

First, I restoring the backup of the database data just with the previous five transactions, and change the multisubaccount of the "Inven13<Inven1" to the "Inven21<Inven2" again. Later I will build the "Inven13<Inven1" if purchasing them.

- Raise funds of \$500,000 cash with interest rate 8% (paying interest at the end of each year) and two years from TD bank on January 7, 2014.

For first entry of the "Cash" account, the Multisubaccount Name box is the "Cash receipts from banks< Financing activities". For second entry of the "Note payable", the Subtotal Name box is the "Long term

liabilities, 251”; the Multisubaccount Name box is “n” because it has not any subaccounts.

- On same day, purchase two lands (Land1, Downtown \$270,000; Land2, North York \$180,000) for \$450,000 cash as available for sale.

For first entry of the “Cash” account, the Multisubaccount Name box is the “Cash payments for investment<Investing activities”.

For the entry of the “Land” account with two one-level subaccounts, the Subtotal Name box is the “Long term investments,141” and the Multisubaccount Name box are the “Land1, Downtown” and “Land2, North York”.

- On January 8, 2014, purchase a truck for \$45,000 cash.

For first entry of the “Cash” account, the Multisubaccount Name box is the “Cash payments to suppliers<Operating activities”. For second entry of the “Truck” account, the Multisubaccount Name box is “n” because it has not any subaccount, and the Subtotal Name box is the “Equipments, 171”.

- On the same day, pay \$367 cash to Ping Wang (Office department) for opening company expenses.

Here, I put the expenses into the “Other expenses” account which has the two-level subaccounts divided by the different persons and the different departments. The “Other expenses” account is under the “Travelling expenses” account, so it may have the row number of the “456”.

Please pay attention here. Due to the “Travelling expenses” account being also divided by the different persons and the different departments, I must give a different multisubaccount name to distinguish them. Its multiSubaccount form is the “Ping Wang-other<Office department-other”. Of course, you can give your distinguishing signal.

- On January 9, 2014, purchase \$25,000 inventory for \$2,000 cash and \$23,000 on credit from C1 Company (phone number: 987654322).

The inventory's multisubaccounts are:

"Inven221<Inven22<Inven2" for \$10*320,

"Inven222<Inven22< Inven2" for \$5*1000,

"PPUK parts <ASD parts< Inven2" for \$4*1200,

"PPGH parts <ASD parts< Inven2" for \$2*1900,

"Inven31<Inven3" for \$ 10*530,

"Inven32<Inven3" for \$5*580.

- On same day, purchase \$12,000 inventory on credit from D1 Company (phone number: 987654323).

The inventory's multisubaccounts are:

"Inven331<Inven33<Inven3" for \$2*1350,

"Inven332<Inven33< Inven3" for \$5*620,

"HGFCVB parts<QASXC parts<Inven3" for \$10*490,

"PPGHUP parts<ASDUP parts<Inven3" for \$10*130.

- On January 11, 2014, Xiao Zhou sales \$17,700 inventory for \$3,500 cash and \$26,000 on credit to E1 Company (phone number: 123456788).

The inventory's multisubaccounts are:

"Inven221<Inven22<Inven2" of cost \$-10*290,

"Inven222<Inven22<Inven2" of cost \$-5*940,

"PPUK parts<ASD parts< Inven2" of cost \$-4*650,

"Inven32<Inven3" of cost \$-5*380,

"HGFCVB parts<QASXC parts<Inven3" of cost \$-10*480,

"PPGHUP parts<ASDUP parts<Inven3" of cost -\$10*80.

Because the entries number of this transaction are greater than eight, I must divide the transaction into two transactions: one transaction for Inven2 sales and another transaction for Inven3 sales, or one transaction for cash, account receivable, and sales, and another for inventory and cost of sales. Here, I use the second method to divide this transaction. The two sub-equations are:

Cash (1): 3500 + Account receivable (1): 26000 = Sales (4): 29,500

Inventory (1): -17700 = -Cost of sales (5): 17,700

- On January 15, 2014, ZhenDao Yuan sales \$13,200 inventory for \$21,700 on credit to F1 Company (phone number: 123456787).

The inventory's multisubaccounts are:

“PPGH parts<ASD parts<Inven2” of cost \$-2*1550,

“Inven31<Inven3” of cost \$-10*500,

“Inven331<Inven33<Inven3” of cost \$-2*1100,

“Inven332<Inven33< Inven3” of cost \$-5*580.

- On January 17, 2014, purchase \$12,500 inventory on credit from G1 Company (phone number: 987654324).

The inventory's multisubaccounts are:

“Inven411<Inven41<Inven4” for \$5*1020,

“Inven412<Inven41<Inven4” for \$2*1850,

“TTTCU parts<TTT parts<Inven4” for \$2*1150,

“RRRHJK parts< Inven4” for\$ 2*700.

- On the same day, receive \$21,000 cash from E1 Company (phone number: 123456788) with the General ID 12.

Please pay attention, the General ID 12 must be the General ID of the transaction including the “Account receivable” account because the previous transaction is divided into two transactions.

Entering an existed customer’s phone number gets the Figure 44.

The screenshot shows a 'Transaction' window with a title bar and a close button. The main area displays the accounting equation: **Assets(1) = Liabilities(2) + Equity(3) + Incomes(4) - Expenses(5)**. Below this, there are input fields for transaction details: Trans date (1/17/2014), Explanation (any (phone number: 123456788)), Class (1), Account Name (Account receivable), Amount (-21000), and MultiSubaccount Name (123456788). A 'Reference' field is also present, currently empty. Below the input fields is a table with the following data:

No.	TransDate	Class	Account Name	MultiSubaccount Name	Amount
2	1/17/2014	1	Cash	Cash receipts from customers<Operating activities	21000

A 'Continue' button is located to the right of the table.

This screenshot is identical to the previous one, but the 'Reference' field now contains the value '12'. The 'Continue' button is highlighted with a blue border.

Figure 44 Reference Box’s other use

The Reference box is enabled (seeing the Figure 34) while entering the phone number. The “Account receivable” account is not a new account, so I do not need to enter a row number. Why? Here, you must pay an attention for that. In fact, when I receive the \$21000 cash, I know that E1 Company pays the cash. However, the computer does not know that, so I must tell the computer which customer pays the cash. I borrow the Reference box to enter the General ID of the previous related transaction, which can be gotten from the general equation table or each customer’s table or account receivable table and is 12. Maybe you ask why I do not use the customer’ phone number as the judging signal. Because I may sale the inventory to this customer for a few of times and the General ID of a transaction is sole, I must choose the General ID as the judging signal. The Figure 45 shows the relationship between the ID 2 transaction with the General ID 12 and the ID 4 transaction with the Reference 12 in the account receivable table, and the customer table.

MathAccounting

Figure 45 Relationships between General ID 12 and General ID 17

- On January 21, 2014, pay \$14,000 cash to C1 Company (phone number: 987654322) with the General ID 10.

The Same thing is for the suppliers about the Reference box.

- On same day, pay \$6,000 cash to D1 Company (phone number: 987654323) with the General ID 11.
- On January 22, 2014, purchase \$21500 inventory on credit from C1 Company (phone number: 987654322).

The inventory's multisubaccounts are:

“PPUK parts<ASD parts<Inven2” for \$4*1625,

“PPGH parts<ASD parts<Inven2” for \$2*3000,

“Inven31<Inven3” for\$ 10*530,

“Inven32<Inven3” for \$5*740.

- On January 23, 2014, Yi Liu sales \$12,000 inventory for \$19,900 on credit to F1 Company (phone number: 123456787).

The inventory's multisubaccounts are:

“PPUK parts<ASD parts<Inven2” of cost \$-4*825,

“PPGH parts<ASD parts<Inven2” of cost \$-2*1950,

“Inven31<Inven3” of cost \$-10*250,

“Inven32<Inven3” of cost \$-5*460.

- On January 25, 2014, ZhenDao Yuan sales \$7,500 inventory for \$13,700 on credit to H1 Company (phone number: 123456786).

The inventory's multisubaccounts are:

“PPUK parts<ASD parts<Inven2” of cost \$-4*750,

“PPGH parts<ASD parts<Inven2” of cost \$-2*900,

“Inven31<Inven3” of cost \$-10*270.

- On January 28, 2014, purchase \$5,600 computers equipment for \$5,600 cash.

The computer account has three one-level subaccounts: computer1 (\$1,600), computer server (\$1,800), and POS system (\$2,200). It belongs to the Subtotal of the “Equipments”.

- On January 29, 2014, Jun Wang sales \$3,500 inventory for \$6,200 on credit to B1 Company (phone number: 123456789).

The inventory’s multisubaccounts are:

“PPUK parts<ASD parts<Inven2” of cost \$-4*550,

“Inven32<Inven3” of cost \$-5*260.

- On January 30, 2014, receive \$2,000 cash from B1 Company (phone number: 123456789) with the General ID 5.
- On the same day, receive \$15,000 cash from F1 Company (phone number: 123456787) with the General ID 14.
- On the same day, receive \$8,000 cash from H1 Company (phone number: 123456786) with the General ID 23.
- On the same day, pay \$7,000 cash to C1Company (phone number: 987654322) with the General ID 10.
- On the same day, pay \$232.76 cash to Dan Zhu (Purchase department) for travelling expenses \$178 and the other expenses \$54.76.
- On the same day, pay \$221.30 cash to Hua Li (Purchase department) for travelling expenses \$135.12 and the other expenses \$86.18.
- On the same day, pay \$339.52 cash to Xiao Zhou (Sales department) for travelling expenses \$243 and

the other expenses \$96.52.

- On the same day, pay \$132.26 cash to Jun Wang (Sales department) for the other expenses.
- On the same day, pay \$82.33 cash to Zhendao Yuan (Sales department) for the other expenses.
- On January 31, 2014, receive \$13,000 cash from F1Company (phone number: 123456787) with the General ID 22.
- On the same day, pay \$8,000 cash to G1Company (phone number: 987654324) with the General ID 15.
- On the same day, pay \$419.55 cash to Yi Liu (Sales department) for travelling expenses \$347.7 and the other expenses \$71.85.
- On the same day, record the office supplies expenses \$88.
- On the same day, pay \$18,756 cash for all salary of January, 2014.

Here, I just consider the total salary and have no detail of the payments. I will develop the function later.

- On the same day, record the truck's amortization expenses \$750 one month (5 years, straight line, and full first month).

The "Amortization expenses" account is a parent account which will appear in the income statement. It has a one-level subaccount "Truck-amortization" now.

The "Accumulated amortization" is a contra account of the "Truck" account, so I should reverse the amount of the contra account while putting the contra account into the class 1 accounts. The reversing amount means that increasing amount is the "-" and decreasing amount is the "+". It should be under the "Truck" parent account whose row number is the "172", so its row number should be the "173".

Because the contra account "Accumulated amortization: truck" will also appear in the financial statements, it seems a parent account and has a one-level subaccount "Truck-accumulated

amortization” now.

There are other contra accounts too, such as the “Allowance for doubtful account” for the “Account receivable” account and the “Discount on bonds payable” for the “Bonds payable” account. The same method can be used for them.

- On the same day, record the computers’ amortization expenses \$101.39.

The “Amortization expenses” account has the two one-level subaccounts of the “Truck-amortization and Computer-amortization” now. The “Computers” account has the three one-level subaccounts: computer1 (two years, straight line, and half first month of \$33.33), computer server (two years, straight line, and half first month of \$37.5), and POS system (three years, straight line, and half first month of \$30.56). So, for the “Computer” account, its “Amortization expenses” account should have three two-level subaccounts:

“Computer1- amortization< Computer - amortization”,

“Computer server - amortization<Computer - amortization”,

“POS system - amortization< Computer - amortization”.

The parent account of the “Accumulated amortization: Computer” should be under the parent account “Computer” whose row number is the “174”, so its row number is the “175”. It has the three one-level subaccounts which are:

“Computer1- accumulated amortization”,

“Computer server- accumulated amortization”,

“POS system- accumulated amortization”.

- On the same day, pay \$376.47 cash to Mike Newsome (Office department) for travelling expenses \$298.69 and the other expenses \$77.78.

- On the same day, pay \$280.70 cash for the utility expenses.
- On the same day, pay \$1500 cash for the office rent expenses.
- On the same day, record the note payable's interest expenses \$3,000 and the accrued interest payable $(500,000 * 8\% / 12 * 27/30)$.

I have completed the first month transactions so far. The same things basically are repeated in the following months. Now I can take a glance of the income statement, balance sheet, cash flows statement, and account flows statement. After clicking the IncomeStatement box and entering the ended date of the “1/31/2014” and the tax rate of the “0.3”, I get the Figure 46 which shows that the net earnings is \$7,725.

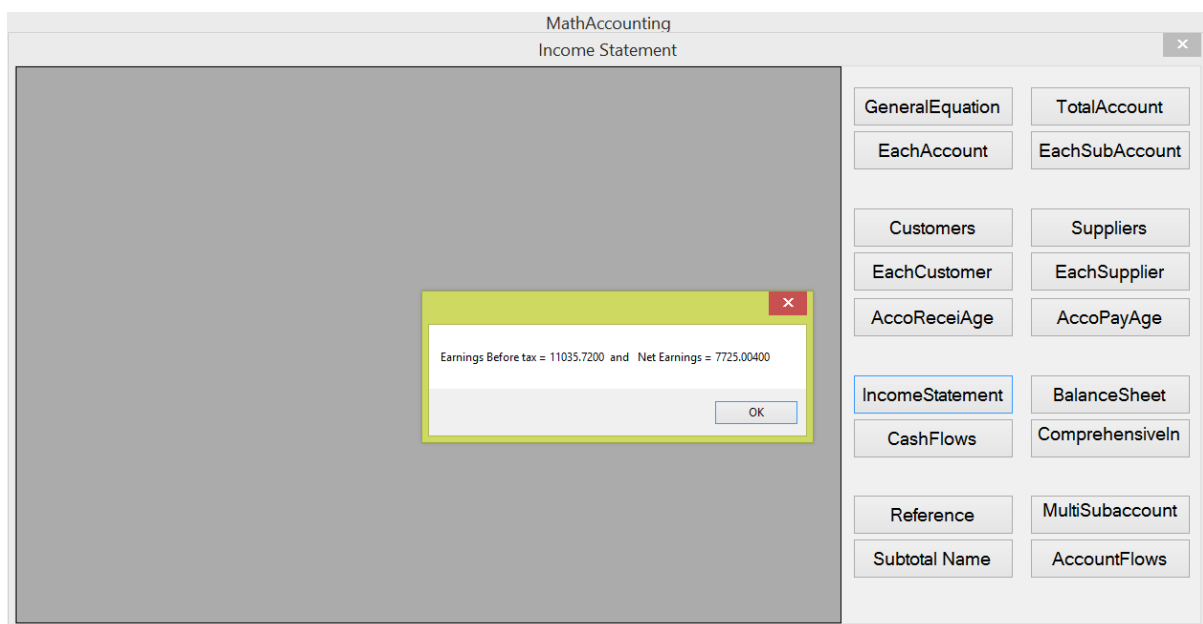

Figure 46 Getting Net Income

Pressing OK box in the Figure 46 and answering the “No” for the question of the “Would you like to begin new fiscal year?” in the appearing information box, I get the income statement table, as shown in the Figure 47. The row under the “Earnings before Income Taxes” are empty and the net earnings are \$11,035.72. Because I do not enter the tax expenses which is \$3,310.72 ($\$11,035.72 - \$7,725 = \$3,310.72$) into database and begin a new fiscal year, and the Reports function model does not check anything just as said before, there is not the tax expenses row under the “Earnings Before Income Taxes” and the net earnings is \$11,035.72.

Clicking the BalanceSheet box gets the Figure 48 which shows the balance sheet table. The total assets are \$561,035.72, and the total liabilities and shareholders’ equity are \$550,000. Their difference is \$11,035.72. The reason is as same as the income statement’s.

Figure 48 Balance Sheet without Including Net Income

Clicking the CashFlows box gets the cash flows statement. It tells me how the cash amounts changes during a period. From the idea, I can get a new concept: account flows statement if an account has the two-level subaccounts.

Clicking the AccountFlows box and entering the inventory account get the Figure 49 which shows the inventory flows. Because the inventory has four one-level subaccounts, the inventory flows statement only shows the top three the amounts of the one-level subaccounts. The ending inventory for the top three one-level subaccounts is \$17,370 while total ending inventory is \$18,870. The difference between them is \$1,500 which is the balance of the one-level subaccount Inven1.

Figure 49 Inventory Flows Statement

Following is the transaction for the second month:

- On February 1, 2014, purchase the supplies for cash \$103.3.
- On February 3, 2014, purchase \$91,000 inventory on credit from D1 Company (phone number:

987654323).

The inventory's multisubaccounts are:

"HGFCVB parts<QASXC parts<Inven3" for \$10*5960,

"PPGHUP parts<ASDUPparts<Inven3" for \$10*3140.

- On February 4, 2014, Jun Wang sales \$91,200 inventory to E1 Company (phone number: 123456788) on credit \$177,600.

The inventory's multisubaccounts are:

"HGFCVB parts<QASXC parts<Inven3" of cost -\$10*5960,

"PPGHUP parts<ASDUPparts<Inven3" of cost -\$10*3160.

- On February 8, 2014, receive \$5,000 cash from B1 Company (phone number: 123456789) with the General ID 25.
- On February 9, 2014, receive \$10,000 cash from F1Company (phone number: 123456787) with the General ID 14 (\$6700) and the General ID 22 (\$3300).
- On February 11, 2014, receive \$3,500 cash from H1Company (phone number: 123456786) with the General ID 23.
- On February 13, 2014, pay \$2,500 cash to A1Company (phone number: 987654321) with the General ID 4.
- On February 15, 2014, pay \$15,000 cash to C1Company (phone number: 987654322) with the General ID 21.
- On February 17, 2014, pay \$4,000 cash to D1Company (phone number: 987654323) with the General ID 11.
- On February 18, 2014, sell land1 (downtown) for \$360,000 cash.

The sub-equation should be:

$$\text{Cash (1): } 360000 + \text{Land (1): } -270000 = \text{Investment income (4): } 90000$$

The “Subtotal name” should be the “Other income, 475”, so the “Investment Income” row is the “476”.

- On the same day, purchase 10,000 the MicroQQ Company shares for \$35.67 each share.
- On February 25, 2014, receive \$120,000 cash from E1 Company (phone number: 123456788) with the General ID 48.
- On February 26, 2014, pay \$55,000 cash to D1Company (phone number: 987654323) with the General ID 47.
- On February 28, 2014, pay \$55.32 cash to Dan Zhu (Purchase department) for the other expenses.
- On the same day, pay \$458.39 cash to Hua Li (Purchase department) for travelling expenses \$336.41 and the other expenses \$121.98.
- On the same day, pay \$33.72 cash to Xiao Zhou (Sales department) the other expenses.
- On the same day, pay \$152.31 cash to Jun Wang (Sales department) for the travelling expenses.
- On the same day, pay \$1,015.98 cash to Zhendao Yuan (Sales department) for the other expenses.
- On the same day, pay \$117.95 cash to Yi Liu (Sales department) for travelling expenses \$99.8 and the other expenses \$18.15.
- On the same day, record office supplies expenses \$101.28.
- On the same day, pay \$18,756 cash for all salary of February, 2014.
- On the same day, record the truck’s amortization expenses \$750 one month (5 years, straight line, and second month).
- On the same day, record second month computers’ amortization expenses (\$202.78).

The computer account has three one-level subaccounts: computer1 \$66.67, computer server \$75, and

POS system \$61.11.

The sub-equation is:

$$\begin{aligned} &\text{Accumulated amortization: computer (1) } -66.67 + \text{Accumulated amortization: computer (1) } -75 \\ &+ \text{Accumulated amortization: computer (1) } -61.11 = -\text{Amortization expenses (5) } 66.67 - \\ &\text{Amortization expenses (5) } 75 - \text{amortization expenses (5) } 61.11. \end{aligned}$$

The left three items of the equation have respectively their multiSubaccounts which are the “Computer1-accumulated amortization”, the “Computer server-accumulated amortization”, and the “POS system-accumulated amortization”. The right three items of the equation have respectively their multiSubaccounts which are the “Computer1-amortization<Computer- amortization”, the “Computer server-amortization<Computer-amortization”, and the “POS system - amortization Computer-amortization”. The Figure 50 shows the detail information of the subaccount of the “POS system-accumulated amortization”.

MathAccounting

Figure 50 Subaccount of the POS System- accumulated Amortization

- On the same day, pay \$293.37 cash for the utility expenses.
- On the same day, pay \$1,500 cash for the office rent expenses.
- On the same day, record the note payable's interest expenses \$3,333.33 and the accrued interest payable $(500,000 * 8\% / 12)$.

If RR Company ends its first fiscal year on February 28, 2014, I can get the Figure 51 by clicking the IncomeStatement box. The Figure 51 shows the earnings before income taxes: \$160,665.29. If the income tax rate is 0.3, then the tax payable is: $\$160,665.29 * 0.3 = 48,199.59$ and the net earnings is: $\$160,665.29 - \$48,199.59 = \$112,465.70$.

Figure 51 Getting Earnings before Income Tax

To get the income statement, balance sheet, cash flows, and comprehensive income statement and begin a new fiscal year, I need enter the following transactions.

- On February 28, 2014, record the tax expenses \$48,199.59 and tax payable \$48,199.59.

After entering the transaction, the net earnings will transfer into the end retained earnings.

- On the same day, record the land's unrealized holding gain or loss. The land (land2, North York) has fair price of \$210,000.

Due to the land being the AFS investment, I must calculate the unrealized holding gain or loss (OCI) and the accumulated other comprehensive income (AOCI). A similar method of dealing with the accumulated amortization account can be used for dealing with the accumulated other comprehensive income (AOCI) account. So the accumulated other comprehensive income (AOCI) account is also a contra account of the land account.

The Unrealized holding gain or loss account, which is the difference between the fair price and the cost price, will be put into the fourth class accounts. If the amount of this account is negative, it means the unrealized holding loss. The fair price is \$210,000 and the cost is \$180,000, so the sub-equation is:

$$\begin{aligned} \text{Accumulated other comprehensive income of land (1): } 30000 &= \text{Unrealized holding gain or} \\ \text{loss (4): } 30000 \end{aligned}$$

Here, you must pay attention that the increase of the "Accumulated other comprehensive income (AOCI)" means the "+" because I put the "Unrealized holding gain or loss" into the fourth class accounts.

If you wish put the "Unrealized holding gain or loss" into the fifth class accounts, then the meaning of the "Accumulated other comprehensive income (AOCI)" account's increasing or decreasing is as same as the "Accumulated amortization" account's.

The “Accumulated other comprehensive income: land” and the “Unrealized holding gain or loss” accounts all have the one-level subaccounts, and their respective Subtotal names are the Long term investments, 141 and Other comprehensive income, 713.

- On the same day, record the share’s unrealized holding gain or loss. The share’s market price is \$35.21 each.

The transaction is same as the previous transaction. The unrealized holding gain or loss of MicroQQ share is -\$4,600. The sub-equation is:

Accumulated other comprehensive income: share (1): -4600 = Unrealized
holding gain or loss (4): -4600

The Figure 52, Figure 53 (after beginning new fiscal year), Figure 54, and Figure 55 respectively show the RR Company’s four tables: Income statement, Balance sheet, Cash flows, and Comprehensive income statement.

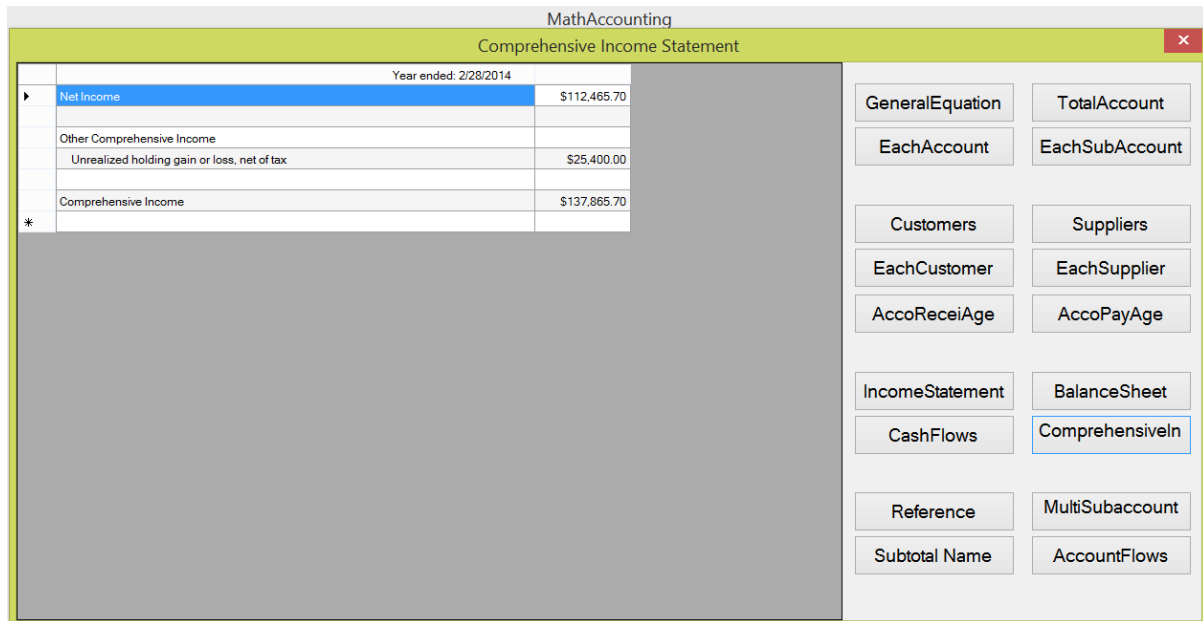

Figure 55 Comprehensive Income Statements

The Figure 55 shows the total unrealized holding gain or loss \$25,400 which is consisted of the land's unrealized holding gain or loss \$30,000 and the MicroQQ share's unrealized holding gain or loss -\$4,600.

For beginning the new fiscal year, I click the IncomeStatement box and answer the “Yes” for the question of the “Would you like to begin new fiscal year?” in the Figure 56. Of course, I must do the YearBackup before doing this.

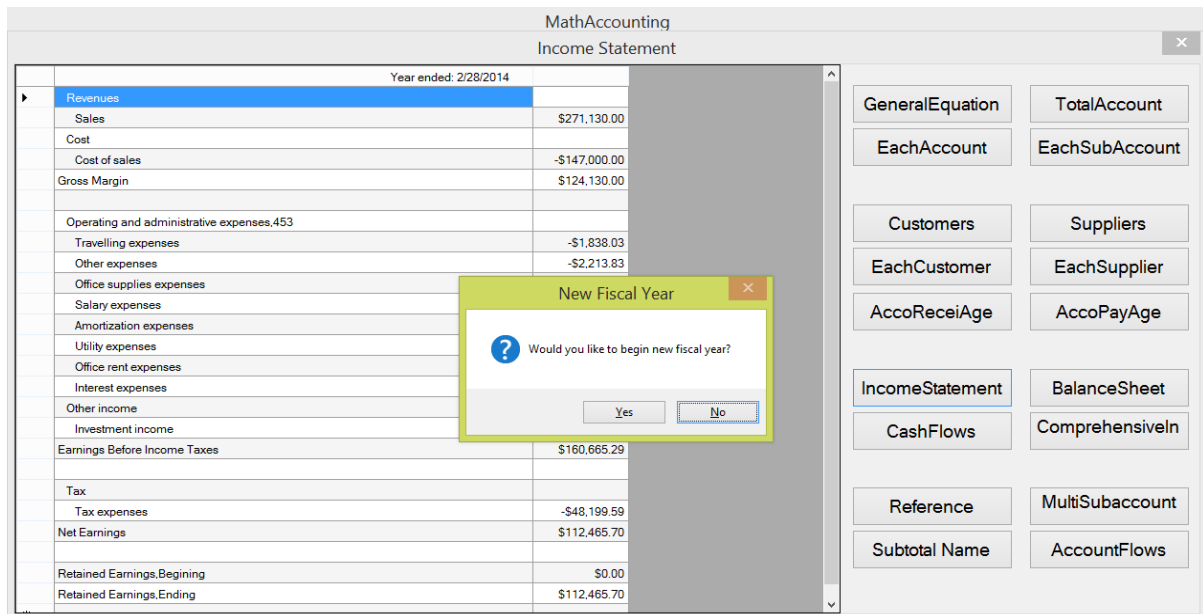

Figure 56 Income Statement interface

In the new fiscal year, I will enter following transactions.

- On March 2, 2014, purchase the supplies for cash \$123.87.
- On March 3, 2014, purchase the \$85,360 inventory on credit from G1 Company (phone number: 987654324).

The inventory's multiSubaccounts are:

"TTTCU parts<TTT parts<Inven4" for \$2*33105,

"RRRHJK parts<Inven4" for \$ 2*9575.

- On March 4, 2014, Yi Liu sales \$85,200 inventory to F1 Company (phone number: 123456787) on credit \$154,800.

The inventory's multiSubaccounts are:

"TTTCU parts<TTT parts<Inven4" of cost -\$2*33035,

"RRRHJK parts<Inven4" of cost -\$2*9565.

- On March 10, 2014, receive \$52,000 cash from E1 Company (phone number: 123456788) with the

General ID 48.

- On March 12, 2014, receive \$1,430 cash from B1Company (phone number: 123456789) with the General ID 5 (\$230) and the General ID 25 (\$1200).
- On March 13, 2014, receive \$2,200 cash from H1Company (phone number: 123456786) with the General ID 23.
- On March 14, 2014, pay \$500 cash to A1Company (phone number: 987654321) with the General ID 4.
- On March 15, 2014, pay \$4,500 cash to C1Company (phone number: 987654322) with the General ID 21.
- On March 17, 2014, pay \$30,000 cash to D1Company (phone number: 987654323) with the General ID 47.
- On March 28, 2014, pay \$153.72 cash to Mike Newsome (Office department) for the other expenses.
- On March 29, 2014, receive \$120,000 cash from F1Company (phone number: 123456787) with the General ID 78.
- On same day, pay \$82,360 cash to G1Company (phone number: 987654324) with the General ID 77.
- On the same day, pay \$171.63 cash to Hua Li (Purchase department) for travelling expenses \$101.33 and the other expenses \$70.30.
- On the same day, pay \$52.17 cash to Xiao Zhou (Sales department) the other expenses.
- On the same day, pay \$129.34 cash to Jun Wang (Sales department) for the travelling expenses.
- On the same day, pay \$111.93 cash to Zhendao Yuan (Sales department) for the other expenses.
- On March 30, 2014, pay \$1,210.91 cash to Yi Liu (Sales department) for travelling expenses \$1132.56 and the other expenses \$78.35.
- On the same day, pay \$201.99 cash to Ping Wang (Office department) for the other expenses.

- On March 31, 2014, record office supplies expenses \$101.28.
- On the same day, pay \$23,790 cash for all salary of March, 2014.
- On the same day, record the truck's amortization expenses \$750 one month (5 years, straight line, and third month).
- On the same day, record the computers' amortization expenses (\$202.78). The computer account has three one-level subaccounts: computer1 \$66.67, computer server \$75, and POS system \$61.11.
- On the same day, pay \$323.14 cash for the utility expenses.
- On the same day, pay \$1,500 cash for the office rent expenses.
- On the same day, record the note payable's interest expenses \$3,333.33 and the accrued interest payable $(500,000 \times 8\% / 12)$.

The Figure 57 shows the income statement without entering the tax expenses and beginning a new fiscal year.

The earnings before income taxes is equal to the net earnings \$37,567.78 in the Figure 57. The difference between the total assets (\$762,799.73) and the total liabilities and shareholders' equity (\$725,231.95) in the Figure 58 is just equal to the earnings before income taxes \$37,567.78.

Figure 58 Balance Sheets without Beginning New Fiscal Year

If I will begin a new fiscal year on April 1, 2014 to check whether the income statement and the balance sheet are correct, I must enter following transactions.

- On March 31, 2014, record the tax expenses \$11,270.33 and tax payable \$11,270.33, and the net earnings will transfer into the ending retained earnings.
- On the same day, record the land's unrealized holding gain or loss. The land (land2, North York) has fair price of \$235,000.

The Unrealized holding gain or loss account is now the difference between the fair price and the carrying value. The fair price is \$235,000 and the carrying value is \$210,000, so the sub-equation is:

Accumulated other comprehensive income: land (1): 25000 = Unrealized holding gain or
loss (4): 25000

The "Accumulated other comprehensive income: Land" and the "Unrealized holding gain or loss" accounts all have the one-level subaccounts.

- On the same day, record the share's market price is \$39.78 each.

The transaction is same as the previous transaction. The unrealized holding gain or loss of MicroQQ is \$45,700, and the sub-equation is:

Accumulated other comprehensive income: share (1): 45700 = Unrealized holding gain or loss (4):
45700

After answering the "Yes" for the question "Would you like to begin new fiscal year?", I get the income statement, balance sheet, cash flows (including the cash account table), and comprehensive income statement in the Figure 59-62. Please notice the changes of the AOCL, Accumulated amortization, the Cash (Beginning) and the Cash (Ending).

Figure 62 Comprehensive Income Statements

If a company will like to use the MathAccounting software during its current fiscal year, it is easy to begin the mathematical accounting. For any company, the balances of all accounts are satisfied the dynamic accounting equation, so you can enter a transaction which includes all the accounts and their related information to complete the transference in theory. However, because of the limtion of maximum eight entries in a transaction (I will increase the entries' number in a transaction later), you must divide the dynamic accounting equation into the N sub-equations. No matter how you combine the accounts in a transaction, the only requirement is that each sub-equation must be balanced exception of the “Account receivable” and the “Account payable” accounts.

Because the MathAccounting software needs the transaction dates of the “Account receivable” and the “Account payable” accounts, the only same transaction date of account receivable and account payable can be combined into a new transaction in the MathAccounting software. The following is a example.

For a customer (phone: 567891234), the detail of its account receivable balance is:

Tranction date: Janurary 3, 2014, balance: \$980,

Tranction date: Janurary 19, 2014, balance: \$1,230,

Transaction date February 27, 2014, balance: \$5,500.

For a supplier (phone: 123498765), the detail of its account payable balance is:

Transaction date: January 8, 2014, balance: \$1,400,

Transaction date: January 19, 2014, balance: \$1,860,

Transaction date February 28, 2014, balance: \$6,900.

Then, the account receivable and account payable with same transaction date can be combined into a new transaction in the MathAccounting software. The new transaction may be:

Account receivable (1): 1230 + Cash (1): 630 = Account payable (2): 1860

Here, cash \$630 is only the part of this Company's cash account balance. Of course, you can add more items to the sub-equation until the maximum number of eight items to make the sub-equation balance.

4. Introduction of SQL Server

Now, I will simply introduce SQL Server and look at how the SQL Server works and what the SQL Server do for us behind the screen. Of course, Oracle database can also be used in the MathAccounting software.

SQL Server 2012 is a powerful database and its security is guaranteed by three levels of principles: Windows, SQL server, and Database.

The "behind the screen" means that you can use the MathAccounting software even without understanding the SQL Server. After executing the SQL Server and entering password, I click the small box with the "+" beside the databases at the left of the screen, and then click the small box with the "+" beside the jgp1 again, seeing the first figure in the Figure 63. For database jgp1, I am interested in the tables, so I click the small box beside the tables and get all tables, seeing the other figures in the Figure 63.

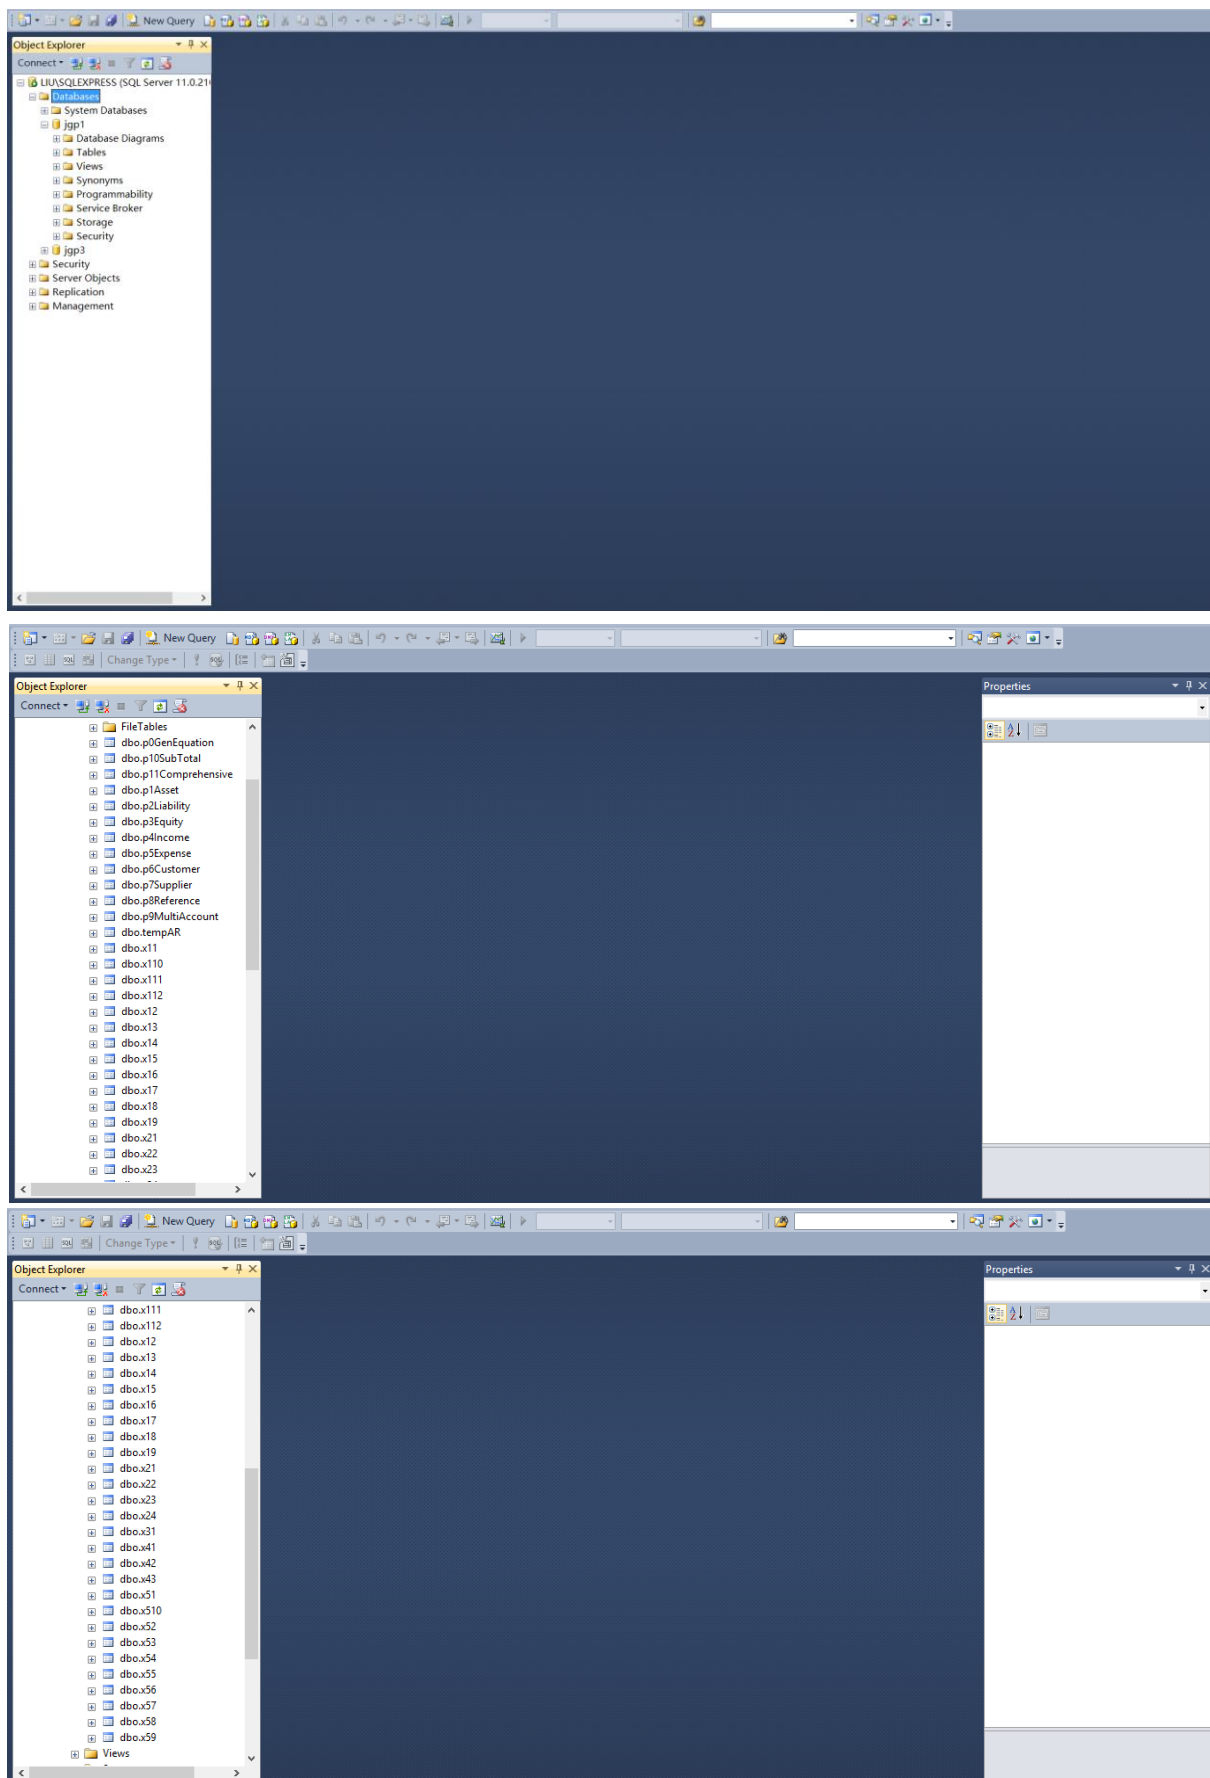

Figure 63 Database jgp1 and All Tables

The SQL Server has built many tables for the company. You should understand what the top twelve tables mean from their names. The first Table should be the General equation table. However, what are the tables of x11, x12, and x21...? In fact, I use a similar method of the coordinate exchange in the numerical calculation in programming the MathAccounting software. By using of this method, I exchange the real names of all parent accounts, which I enter into the database in the transaction function model, to the mathematical names according to their entering order to categorize and calculate them. I use the “New Query” to show the p0GenEquation and x13 tables in the Figure 64. The table p0GenEquation is indeed the “General equation” table and the x13 table is the “Inventory” table which I entered third.

SQL Query1.sql - BEN...RESS:jgp1 (sa (53))

```
use jgp1
select * from p0GenEquation
```

Figure 64 General Equations and Inventory Account Table

5. Accounting Future

Finally, I will introduce a concept of the great accounting, which is based on the MathAccounting software and the wealth conservation law, in detail. The great accounting means two aspects.

In the great data time, centered management of accounting is an inexorable trend. Every business company can login in a government's centered database by using of its business number.

There is a famous law of the "Energy conservation law" in natural science. The every different exposition of this law has promoted science development. The most famous exposition of the law is atomic theory. Similarly, I think that there is a law of the "Wealth conservation law" in social science. Every department in an organization can do part work of the accounting about itself duty. All works of the organization's departments will be made up of the financial statements. The great accounting has many advantages, such as being difficult to draw up false accounts and to evade a tax.

Now, the accounting department is too powerful. It not only manages cash, but also is responsible of being made up of the financial statements. However, many accounting data are second data which come from other departments. There may be some problems in the financial statements under special circumstances. The accounting department's duty should be to manage the cash. Every department in an organization can do part work of the accounting about itself duty. All works of the organization's departments will be made up of the financial statements which is are reliable and correct.

5.1 Great accounting

The many expenses are related to every employee in an organization, but the salary expenses is the most expense of every employee. So, the design of the multi-subaccount of the "Salary expenses" account is very important in the great accounting software.

If an organization has 99 factories in the different places and the maximum number of every department's

employees in a factory is 9999, the three-level subaccount of the “Salary expenses” account is every employee ID which may be every employee’s phone number or social insurance number. Its multi-subaccount’s form is the “Employee ID<Different department <Different factory”. If an organization has only different departments, the two-level subaccount of the “Salary expenses” account is every employee ID. Its multi-subaccount’s form is the “Employee ID<Different department”.

The other expenses can be distinguished from the salary expenses by adding a symbol. Its multi-subaccount’s form is the “Employee ID-xxxx<Different department-xxxx<Different factory-xxxx”.

The Figure 65 shows a typical organization structure which may have fifteen departments: accounting department, office department, human resource department, production department, equipment department, purchases department, sales department, inventory management department, research development department, and other departments. After clicking the fifteen boxes respectively, you get the same interface (seeing the Figure 66). The accounting department can use four functions. However, the other departments can only use transaction and report functions. Then they can use the MathAccounting software to deal with themselves transactions.

The transaction function is same for every department. The report function has three situations: one for the accounting department, one for human resource department, and last one for other departments, seeing the Figure 67. Every department can show all transactions in this paper. By adding a searching condition of the “Group by department”, each department can only show itself transactions except for the accounting department.

The great accounting’s data is same as MathAccounting software in the following transactions. However, some expenses are distributed to every department, such as the “Supplies expenses” account. The “Supplies” account has two recording methods.

- The supplies are purchased by the purchases department and transferred into the inventory department.

Then every department can pick up them and record its supplies expenses.

- Every department purchases its supplies and record its supplies expenses.

I use the first method for simplicity.

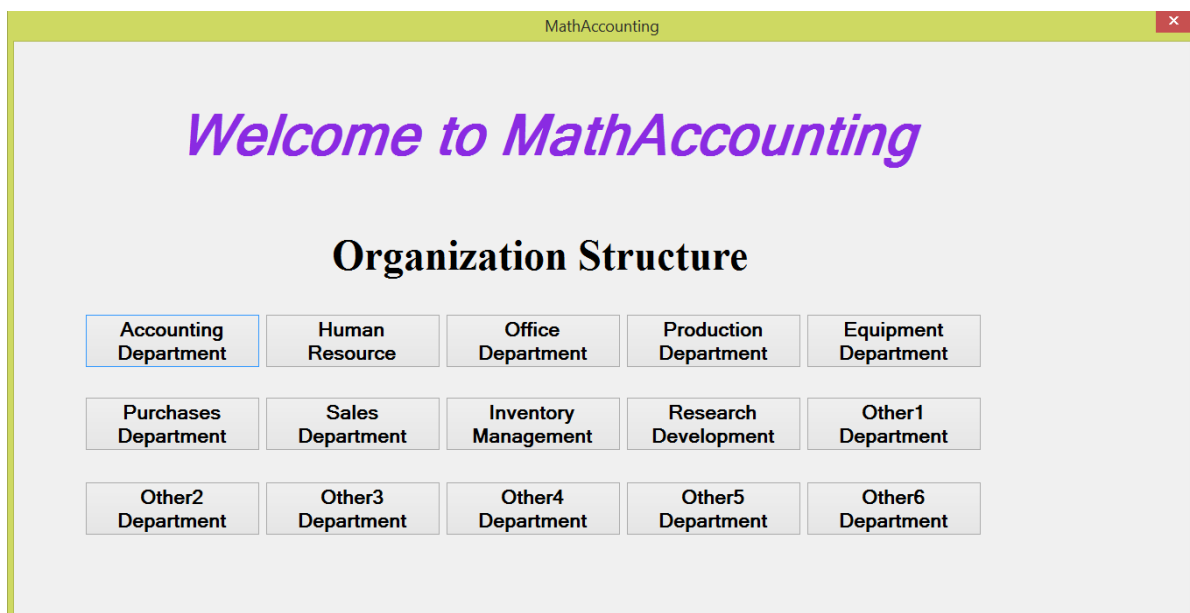

Figure 65 Organization Structure

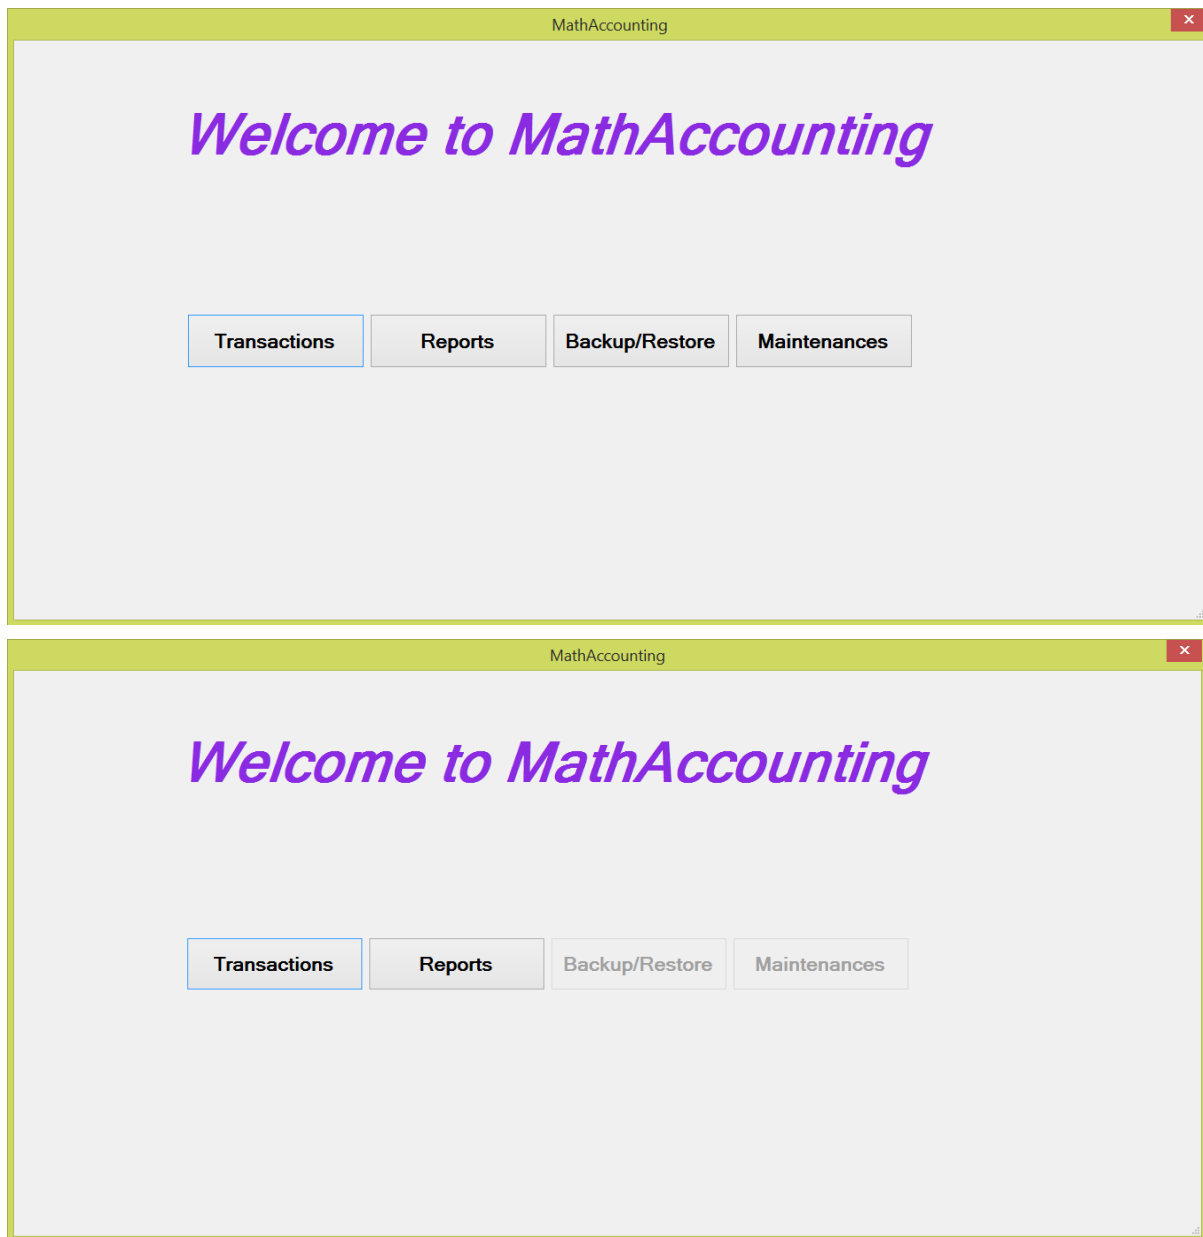

Figure 66 MathAccounting Interface

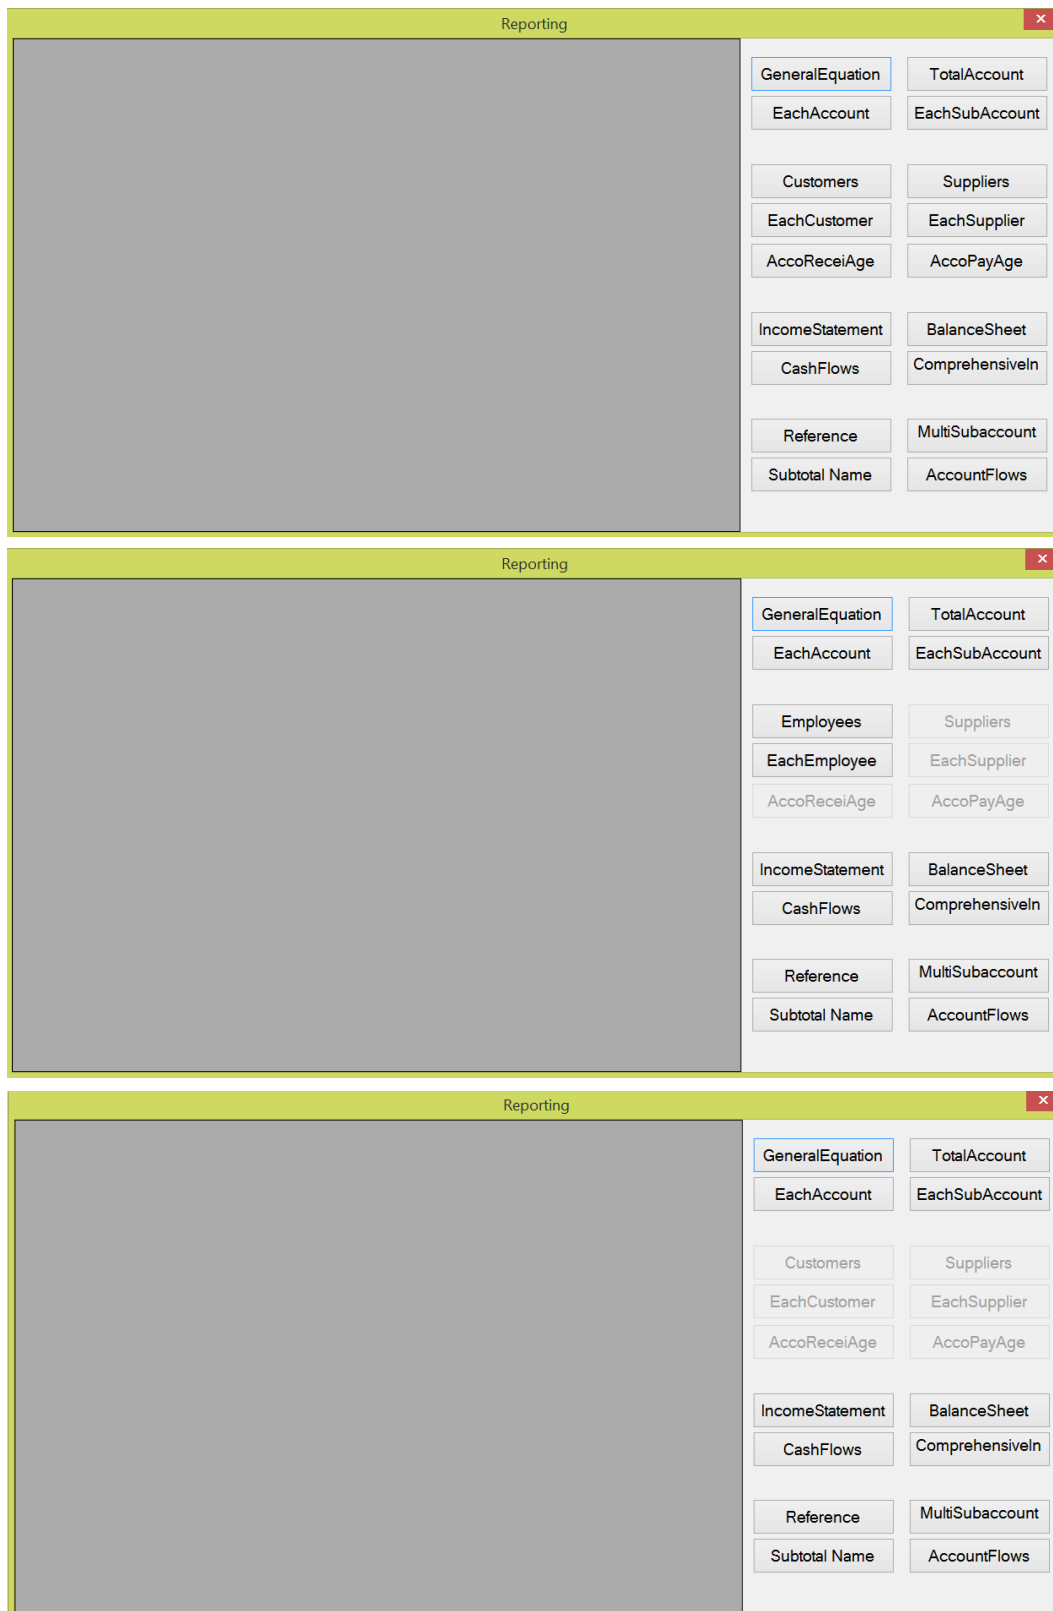

Figure 67 Report Interface

5.1.1 Accounting Department

Accounting department duty is only to pay the cash according to the other departments' requirement except for recording itself salary expenses according to actual attendance and miscellaneous expenses.

Every employee's salary expenses is planned by the human resource department. According to actual attendance, some employees' actual salary expenses of the accounting department may be corrected by the accounting department.

If I do not wish too many expenses account appear in financial statements, I can use a parent account of the "Miscellaneous expenses" which may have the one-level subaccounts: Travelling expenses, Supplies expenses, and so on; the two-level subaccounts: Different department-travelling, Different department-supplies, and so on; the three-level subaccounts: Employee ID-travelling, Employee ID-supplies, and so on. The "Miscellaneous expenses payable" account has the one-level subaccounts of the "Employee ID-miscellaneous expenses payable".

5.1.2 Human Resource Department

The Human Resource department's main duty is to build every employee's profile including planned salary expenses and salary payable at beginning of every month. Of course, it also records itself salary expenses according to actual attendance and its miscellaneous expenses.

The "Salary expenses" account has the three-level subaccounts. Its multi-subaccount form is the "Employee ID<Different department<Different factory". The "Salary payable" account has the two-level subaccounts. Its multi-subaccount form is the "Employee ID-xxxx<XXXX payable". Here, I use the nature number as the employee ID. Of course, the employee's phone number or social insurance number is also used as the employee ID.

When entering a new employee ID which is a three-level subaccount of the parent account “Salary expenses” into the MultiSubaccount box, some boxes of employee’s information are enabled. Then you can build this employee’s profile, seeing the Figure 68.

The Figure 69 shows all employees’ profiles and an employee’s profile (employee ID 3).

5.1.9 Research Development Department

Research development department duty is to record the research development expenses except for recording itself salary expenses according to actual attendance and its miscellaneous expenses.

5.2 Sample of an accounting fiscal year

Last thing is to enter more transactions to complete an accounting fiscal year. During entering these transactions, I use the different department's model to deal with itself related transactions. Finally, I get the five tables: Income Statement, Balance Sheet, Cash Flows Statement, Comprehensive Income Statement, and Account Flows Statement which are same as the MathAccounting software.
