

Cognition in Parkinson's Disease

Category

Parkinson's Disease

Enrollment Closing Date

October 2021

Description

Dr. Harrington is conducting research to find out more about how the brain controls cognitive processes in Parkinson's disease and whether brain functioning is related to genes that affect how brain cells work. We are looking for people who have Parkinson's disease. We also are looking for adults without Parkinson's disease who are in good health. Volunteers will receive an MRI scan and cognitive testing.

Requirements

- * 50 to 82 years old
- * No other neurological condition (e.g., stroke, head injury, epilepsy, dementia) or a psychiatric condition (e.g., post traumatic stress disorder)

Benefits

* There will not be a direct benefit to you from the study procedures. We may learn more about how the brain controls cognition in Parkinson's disease and if brain functioning relates to genes that affect how brain cells work.
