

PSA Vaccine Study

Category

Cancer/Cancer Prevention

Enrollment Closing Date

not applicable

Description

This study is recruiting men with a previous diagnosis of prostate cancer to test the safety and effectiveness of the study drug. Eligible men will have rising PSA without evidence of disease on scans. Subjects receive 6 study injections over a 3 month period and are then followed for approximately 2 years with clinic visits, blood draws and bone and CT scans. All subjects receive the study drug.

Requirements

Potential participants must be screened using blood draws and scans and an EKG to determine eligibility.

Benefits

It is not known whether this study will benefit participants. Study subjects are in close contact with the study team.
