

My Take On Science & God.

February 26, 2012 at 4:05am

As I explore the topic of existence, I've come across these learning blocks I thought I'd share as one perspective of how the cookie kinda crumbles. I could be right, I could be wrong. As i continue to evolve & learn, i'm just taking notes.

Maybe that's why God knows everything that happens before it happens? b/c- according to certain aspects of Space & Time, many things around us have already happened. We're surprised, but the Universe knows what's up.

In many ways, we are sum-odd billion light yrs behind actual Time. Also keep in mind that light travels 4 times- not once, but FOUR times - around the Earth in one minute. Try to calculate all that PLUS the things that science has never and probably will never assume, & THEN tell me an alpha-creator doesn't exist, thus leading to my next point.

Science wasn't created to discredit God. It was created to show the magnificence of what God's provided for us from the most logical perspective. Science is here to show the beauty of how a flower is constructed, of how the Earth can grow everything we need, when we don't understand the mechanics. It keeps us entertained, intrigued with why there's no explanation for the Earth's lava core.

How can the average mind truly know/appreciate/understand "all of that which is", when they're an actual PART of its evolution? That's like seeing one's organs outside of their body...

I hope to remind myself; Don't worry about everything you don't know. Just know that you don't know everything and appreciate the beauty in the journey of learning as much as you can while you're present.

Idk. Just my thoughts. From the Ashes, Charlizero
