

PRODUCT DATA SHEET

Gold Nanoparticles – Anti-PV1 / PLVAP Antibody

Features

- Functionalized with anti (mouse) PV1/PLVAP antibody (MECA-32)
- Targets nanoparticles to mouse endothelial cells.
- A range of available sizes: 15 to 200 nm diameter.
- High monodispersity (PDI < 0.2) and circularity (> 0.9).
- Can be labeled with a fluorescent dye: FAM, Cy3, Cy5, Cy7.

General Information

Polyethylene glycol (PEG) grafting introduces a terminal anti (mouse) PV1 / PLVAP antibody (MECA-32 Antibody). Plasmalemma vesicle associated protein (PLVAP) is expressed on most endothelial cells in the embryonic and adult mouse, with the exception of cardiac and skeletal muscle and the brain.

Gold nanoparticles can also be tagged with a fluorescence dye using polyethylene glycol (PEG) as a spacer. To prevent fluorophore quenching, longer PEG of 5 kDa is used to ensure the separation between the dye and the nanoparticle surface.

Methoxy-terminated PEG is used as the backfill to stabilize the particles against charge-induced aggregation and to prevent non-specific protein adsorption.

Applications

- Actively targeted fluorescent gold conjugate nanoparticles for *in vitro* and *in vivo* studies.
- Immunocytochemistry, Immunoprecipitation, lateral flow, immunoblotting, immunohistochemistry.
- Nanoparticle-cell interactions using flow cytometry analysis.
- Contrast agents for bright field, dark field, electron microscopy.
