

**DEVELOPMENT OF CORE
OUTCOME SET FOR CONGENITAL
MELANOCYTIC NAEVI**

AIM OF THE PROJECT

To develop an international consensus on the important outcomes to measure, the so called Core Outcome Set (COS), before, during and after treatment for patients with Congenital Melanocytic Naevi (CMN).

The results can be used to:

- Harmonize outcomes reported in CMN studies
- Enable comparison of treatments' effectiveness
- Set up treatment guidelines for CMN

METHODS

- 1. Identify existing knowledge: systematically review published studies**
- 2. Focus group with patients: obtain insight into what patients find most important**
- 3. e-Delphi survey: involve experts in CMN (including YOU) to reach consensus on the Core Outcome Set**
- 4. Consensus meeting**
