Special Feature: Climate Change and Species Range Shifts

Guest Editor: J.K. Bailey

Editorial
3 Incorporating eco-evolutionary dynamics into global change research: a need for a new synthesis
J. K. Bailey

5 Evolution of dispersal and mating systems along geographic gradients: implications for shifting ranges
E. L. Magurran and G. Zucchi

22 Genetic divergence in forrests: understanding the consequences of past and modern environments
A. Korner, B. M. Potts and S. Debo

27 Convergent effects of elevation on functional traits within and among species
D. B. Read, C. E. Moorhead, N. G. Bowman, J. K. Bailey and M. Sanders

46 Climate-driven change in plant-insect interactions along elevation gradients
S. Raupach, L. Petlichkoff, E. Dufresne, J. Jactel and G. Kunstler

56 Are there evolutionary consequences of plant–soil feedbacks along soil gradients?

66 A genotypes-based Community Transfer Function for predicting the impacts of climate change on future communities

75 Partitioning net interactions among plants along altitudinal gradients and their community responses to climate change
R. B. McNaughton, G. C. Siddiqi, J. L. Laurs, R. W. Brooker and A. M. Callaway

87 Indirect genetic effects of vegetation change on insect herbivores: genetic diversity and coadaptation in a climate change context

Perspective
96 How to avoid errors when quantifying thermal environments
H. S. Bruijnzeel and J. A. Angeron Jr.

Plant physiological ecology
106 Leaf form and photosynthetic physiology of Chrysanthemum species: distributional shifts and plant performance in eastern North America
E. B. Sauve and J. T. Gristan

124 Inter-specific trade-off in Populus x canadensis under different nutrient regimes
J. Chen, B. Chen, X. Wang, H. Xue, H. L. C. Li

Animal physiological ecology
130 Partitioning the effects of thermal acclimation between generations of the short-lived mosquito that developed in different environmental conditions
F. Saubach, J. Reisebohr and A. G. Litwiller

Cover Image: Flowers and seed of pink sand verbena (Abronia umbellata). This species is the only plant whose dispersal ability and self-compatibility increase towards range limits (see p. 5).
