Abstract
Syringoma of the vulva, especially as the multiple form, is a rare disorder. A review of the diagnoses in 4,500 patients from the Vulvar Clinic, Hospital de Clínicas José de San Martín, First Chair of Gynecology, Buenos Aires University, revealed only three cases, two of which were asymptomatic. The third patient, with multiple lesions and severe discomfort, is presented. With cryotherapy the lesions healed, and the patient was asymptomatic even during warm weather.
