3. NEW THEMES AND APPROACHES IN SECOND LANGUAGE MOTIVATION RESEARCH

Zoltán Dörnyei

The study of L2 motivation has reached an exciting turning point in the 1990s, with a variety of new models and approaches proposed in the literature, resulting in what Gardner and Tremblay (1994) have called a motivational renaissance. In this chapter I provide an overview of some of the current themes and research directions that I find particularly novel or forward-looking. The summary is divided into three sections: theoretical advances, new approaches in research methodology, and emerging new motivational themes. I argue that the initial research inspiration and standard-setting empirical work on L2 motivation originating from Canada has borne fruit by educating a new generation of international scholars who, together with the pioneers of the field, have applied their expertise in diverse contexts and in creative ways, thereby creating a colorful mixture of approaches comparable to the multi-faceted arena of mainstream motivational psychology.

The first three decades of L2 motivation research until about the early 1990s was largely inspired and fuelled by the pioneering work of social psychologists in Canada, most notably Robert Gardner, Wallace Lambert, Richard Clément, and their associates. Applying versions of a standardized motivation test developed by Robert Gardner’s research group at the University of Western Ontario, the Attitude/Motivation Test Battery (AMTB; for a complete version, see Gardner, 1985), a great deal of empirical research during this period was directed at measuring the association between various aspects of motivation and L2 learning achievement. The emerging body of research studies established motivation as a principal determinant of second language acquisition,
comparable in its impact to another well-researched learner variable, language aptitude.

During these first decades of research, motivation was primarily seen as a relatively stable learner trait that was, to a large extent, a function of (a) the learner’s social perceptions of the L2 and its speakers, as reflected by various language attitudes; (b) generalized attitudes toward the L2 learning situation, such as the appraisal of the course or the teacher; and (c) interethnic contact and the resulting degree of linguistic self-confidence. The 1990s extended this conception by adding a number of cognitive and situation-specific variables to the existing paradigm (e.g., attributions and group cohesiveness), and there was a shift by some toward viewing motivation as a more dynamic factor that is in a continuous process of evolution and change according to the various internal and external influences the learner is exposed to (for a recent review, see Dörnyei, 2001). The traditional approach of computing correlations between motivational and achievement factors gradually gave way to more complex, often qualitative, analyses of motivational antecedents and consequences, resulting in a colorful spectrum of new research directions. This chapter is intended to survey these recent developments and highlight some potentially fruitful areas for future research. First I summarize some general theoretical and research methodological advances, then I describe a number of novel motivational themes emerging in the literature.

Theoretical Advances

The 1990s brought an extraordinary boom in L2 motivation research: Dörnyei (1998a) reviewed over 80 relevant L2 studies from the period, including more than ten newly designed theoretical motivation constructs. The extent of the shift in thinking is probably best characterized by the fact that a new motivation model developed by Robert Gardner’s research laboratory (Tremblay & Gardner, 1995) in response to calls for the adoption of a wider vision of motivation (p. 505), did not actually include Gardner’s best known motivational component, the integrative motive. Approaching the new millennium, the boundaries of L2 motivation were pushed even further, with researchers adopting varied and increasingly complex perspectives. A good cross-section of the emerging new wave of motivational thinking was provided by a colloquium at the annual conference of the American Association for Applied Linguistics in March, 2000 (Vancouver), and by an edited volume partly based on the colloquium proceedings which contains 20 chapters written by researchers from over ten different countries in Asia, Europe, and the Americas (Dörnyei & Schmidt, 2001).

From the point of view of their theoretical novelty, the following five motivational areas appear particularly interesting: social motivation;
motivation from a process-oriented perspective; the neurobiological basis of motivation (see also Schumann, this volume); L2 motivation and self-determination theory; and task motivation.

Social Motivation

In an article deliberating upon the future of applied linguistics, McGroarty (1998) has argued that in order to be able to address the most intellectually challenging and practically significant aspects of language learning and teaching (p. 592), applied linguists need to understand better how the social contexts surrounding language acquisition affect the learning process. This view accords with the recent emergence of a broader perspective in the whole of the social sciences sometimes referred to as an ongoing second cognitive revolution (Hickey, 1997, p. 183) that emphasizes the sociocultural roots of learning and cognition in general. Motivational psychology has not remained immune to the new spirit: in a pioneering article, Bernard Weiner (1994) set out to conceptualize social motivation, involving the complex of motivational influences that stem from the sociocultural environment rather than from the individual. During the past five years, social goals have been the subject of a great deal of research in psychology (cf., Juvonen & Nishina, 1997; Wentzel, 1999).

Because of the inherently social nature of L2 acquisition, the study of the linguistic impact of various sociocultural factors has, in fact, had a relatively long history in the L2 field. In addition to Gardner’s motivation theory, social determinants of L2 learning were the focus of Giles and Byrne’s (1982) intergroup model, Schumann’s (1978) acculturation theory, and Clément and Noels’s (1992; Noels & Clément, 1996) situated language identity theory, although these theories were not always expressed explicitly in motivational terms. In the light of the increasing social awareness in motivational psychology, this line of inquiry is of particular significance and, as emphasized by Clément and Gardner (in press), Dörnyei (in press-a), and McGroarty (2001), L2 motivation as a situated construct will undoubtedly be one of the main targets of future motivation research.

Motivation from a Process-Oriented Perspective

A recent line of investigation that I have been actively involved in has examined the temporal dimension of motivation, that is, the way in which motivational processes happen in time. This question is, I believe, particularly important when the target of interest is a sustained learning process, such as the mastery of an L2, that can take several years to be successfully accomplished. During the course of such a lengthy process, student motivation does not remain constant but undergoes continuous
changes; as Ushioda (1996, p. 240) summarizes, within the context of institutionalized learning especially, the common experience would seem to be motivational flux rather than stability. In view of this, the study of the dynamics of motivational change and the identification of typical sequential patterns and developmental aspects is likely to be a fruitful area for future research. Examples of a process-oriented conception in L2 motivation research include the separation of the initiation of motivation from the process of sustaining motivation by Williams and Burden (1997) and Ushioda's (1998, 2001) analysis of how new motivational orientations evolve while the learner is engaged in the L2 learning process.

The most complex process-oriented construct in the L2 field has been put forward by Dörnyei and Ottó (1998; cf. also Dörnyei, 2001), who devised a process model of L2 motivation which organizes the various motivational influences along a sequence of discrete actional events in the chain of instigating and enacting motivated behavior. The model details how initial wishes and desires are first transformed into goals and then into operationalized intentions, which are seen as the immediate antecedents of action; after action has been initiated, an appraisal and an action control process mediate executive motivation, leading (hopefully) to the accomplishment of the goal and concluded by the final evaluation of the process. In a recent paper summarizing theoretical and practical implications of the process-oriented approach, I have argued (Dörnyei, 2000) that focusing on the temporal aspect of motivation is particularly useful because it allows researchers to discuss both preactional choice motivation (i.e., the motives leading to selecting goals and forming intentions) and volitional/executive factors during the actional phase (i.e., motives affecting ongoing learning behaviors) in a unified framework. Although this research perspective is still relatively new, during the past decade it has been adopted by a growing number of scholars within the field of educational psychology (cf., Snow, Corno, & Jackson, 1996), partly driven by recognition that, by accounting for the dynamic evolution of motivation, we can fully accommodate the learner's active role in controlling and shaping the affective foundation of the learning process. This perspective fits in well with the recent emphasis placed on the study of student self-regulation.

A Neurobiological Explanation of Motivation

A novel line of research that has the potential to revolutionarize the study of L2 motivation has been pursued by John Schumann (1998, 1999, this volume), who has examined second language acquisition from a neurobiological perspective. This work has been one of the first attempts in the L2 field to incorporate the findings of neuroscience and to link the study of language to this particularly dynamically developing discipline.
within cognitive sciences. The key constituent of Schumann’s theory is *stimulus appraisal*, which occurs in the brain along five dimensions: *novelty* (degree of unexpectedness/familiarity); *pleasantness* (attractiveness); *goal/need significance* (whether the stimulus is instrumental in satisfying needs or achieving goals); *coping potential* (whether the individual expects to be able to cope with the event); and *self and social image* (whether the event is compatible with social norms and the individual’s self-concept). These appraisals become part of the person’s overall value system through a special memory for value and are largely responsible for providing the affective foundation of human action. Recently, Schumann (2001) has broadened his theory by outlining a conception of learning as a form of *mental foraging* (i.e., foraging for knowledge), which engages the same neural systems as the ones used by organisms when foraging to feed or mate, and which is generated by an incentive motive and potentiated by the stimulus appraisal system.

Motivation and Self-Determination Theory

One of the most influential paradigms in mainstream motivational psychology has been offered by *self-determination theory* (Deci & Ryan, 1985; Vallerand, 1997), which includes the well-known distinction between *intrinsic motivation* (i.e., performing a behavior for its own sake in order to experience pleasure and satisfaction such as the joy of doing a particular activity or satisfying one’s curiosity) and *extrinsic motivation* (i.e., performing a behavior as a means to an end, that is, to receive some extrinsic reward such as good grades or a raise in salary, or alternatively to avoid punishment). The theory places the various types of regulations on a continuum between self-determined (intrinsic) and controlled (extrinsic) forms of motivation, depending on how internalized they are, that is, how much the regulation has been transferred from outside to inside the individual. Five distinct categories along this continuum have been identified: *external regulation* (i.e., motivation coming entirely from external sources such as rewards or threats); *introjected regulation* (i.e., externally imposed rules that students accept as norms they should follow in order not to feel guilty); *identified regulation* (i.e., engaging in an activity because the individual highly values it and sees its usefulness); *integrated regulation* (i.e., involving choiceful behavior that is fully assimilated with the individual’s other values, needs, and identity); and pure *intrinsic regulation*.

Because learning an L2 almost always contains a combination of external and internal regulatory factors, Noels and her colleagues (Noels, 2001; Noels, Clément, & Pelletier, 1999; Noels, Pelletier, Clément, & Vallerand, 2000) set out to explore how the orientations proposed by self-determination theory relate to various orientations that have traditionally
been identified in the L2 field (e.g., instrumental and integrative orientations). Noels argues that applying the intrinsic/extrinsic continuum can be helpful in organizing language learning goals systematically; she notes, further, that the paradigm is particularly useful for analyzing the classroom climate and the L2 teacher in terms of how much they promote either control or autonomy, a dimension of contrast which has immediate practical implications for educating autonomous, self-regulated L2 learners.

Task Motivation

While it is true that certain motivational perceptions and attributes are generalized across learning situations and remain fairly fixed once established, it is also clear that other motivational factors show considerable variation according to the particular learning event with which they are associated, as evidenced by the varying degrees of interest and commitment students demonstrate toward different learning tasks. This duality of generalized and situation-specific motives was explicitly addressed by Tremblay, Goldberg, and Gardner (1995) when they distinguished trait and state motivation, the former involving stable and enduring dispositions, the latter transitory and temporary responses or conditions. The potential usefulness of such a distinction lies in its capacity to explain learners’ situational and task preferences. Indeed, from a pedagogical point of view, it would be very beneficial to identify components of task motivation, because it would allow curriculum designers and language teachers to systematically select and administer tasks in a motivating manner, thus increasing learner engagement.

In a recent theoretical discussion of task motivation, Julkunen (2001) argues that students’ task behavior is fuelled by a combination of generalized and situation-specific motives according to the specific task characteristics, a position in line with Tremblay et al. s (1995) conclusion that trait motivation influences state motivation. In a study focusing on the motivational background of student engagement in communicative L2 tasks, Dörnyei and Kormos (2000) found that the learner’s overall disposition toward task performance has at least three distinct layers: (a) generalized motives (e.g., integrativeness), (b) course-specific motives (i.e., the appraisal of the L2 course), and (c) task-specific motives (i.e., attitudes toward the particular task). The need to distinguish between the latter two aspects which have traditionally been lumped together under the situation-specific category was highlighted by the finding that, among the learners in our study who displayed low task-attitudes, those who had a favorable disposition toward the course in general participated more actively than those who had unfavorable attitudes toward both the course and the task. Furthermore, in discussing task motivation from a process-oriented perspective, I have argued elsewhere (Dörnyei, 2000) that in
many learning situations there are various levels of increasingly focused
task engagement (e.g., taking up studies in general, enrolling in a
particular course, attending a particular lesson or carrying out a particular
learning task) and that the resulting action-oriented contingencies, or mind
sets, interact with each other in an as yet unspecified manner.

Finally, a further feature of task motivation which makes it a
particularly intriguing research domain is the fact that motivation of
task participants is not independent of each other. It is easy to see that if
one is paired up with a highly motivated or unmotivated partner, this
pairing affects the person’s own disposition toward the task; in other
words, task motivation is *co-constructed* by the participants. I have found
two sources of empirical evidence to support this claim in a follow-up to
the Dörnyei and Kormos (2000) study (Dörnyei, in press-b): First,
students with low task attitudes performed significantly better when their
partner demonstrated high task attitudes. Second, correlations of the
individual students’ attitudes toward the course and the task with their task
engagement index were .32 and .39, respectively, whereas the same
correlations computed for the dyads’ joint performance were .59 and .52,
respectively. That is, when the two task participants merged motivational
and performance indices were correlated, the positive association was
significantly higher.

**New Approaches in Research Methodology**

L2 motivation research has traditionally followed the principles of
quantitative social psychology, making extensive use of the various rating
scales developed for the measurement of attitudes. Data obtained by such
scales have been typically processed by means of inferential statistical
procedures, such as correlation or factor analysis. While this research
tradition is still strong and some particularly large scale investigations
have been reported on recently (e.g., Dörnyei & Clément, 2001: 4,765
primary school pupils in Hungary; Schmidt & Watanabe, 2001: 2,089
university students in Hawaii; Inbar, Donitsa-Schmidt, & Shohamy, 2001: 1,690 secondary school students in Israel), I consider it a significant step
in motivation research that traditional quantitative research methodologies
have been increasingly complemented by qualitative approaches.
Interpretive techniques such as in-depth interviews or case studies are in
many ways better suited to explore the internal dynamics of the intricate
and multilevel construct of student motivation than quantitative methods,
and the richness of qualitative data may also provide new slants on old
questions (Pintrich & Schunk, 1996). The potential of qualitative
research methodology is well evidenced by a series of recent studies in
this vein by Ushioda (1998, 2001), Williams and Burden and colleagues
(1999, 2001), Nikolov (1999, 2001), and Syed (2001), focusing on issues
as diverse as attributions, motivational development, classroom motives, self-motivation, and the motivational impact of the learner’s self-concept.

Quantitative research methodology has not remained unchanged either: the most significant advance in this area has probably been the increasing application of structural equation modeling (SEM) to interpret large, multivariate datasets. Although LISREL models have been used in L2 motivation research since the early 1980s, the past five years have seen an increase in the utilization of the procedure, partly because SEM programs have become easier to handle and more readily available (e.g., as part of SPSS). Recent studies employing SEM techniques include Gardner, Masgoret and Tremblay (1999), Gardner, Tremblay, and Masgoret (1997), Laine (1995), Masgoret and Gardner (1999), and Yamashiro & McLaughlin (2000). Paul Tremblay (2001) offers a very useful methodological overview of how to apply the procedure to best effect.

Emerging New Motivational Themes

In the final section of this chapter, I would like to highlight a number of particularly interesting new research topics that have received attention during the past few years. This selection is necessarily subjective and the coverage of the various topics will be brief.

Teacher Motivation

Although there is ample indirect evidence that the teacher’s own level of motivation is infectious, that is, it has a significant impact on the students’ learning commitment, hardly any research has been done in the past to explore this relationship. Recently, however, a number of theoretical and empirical studies have addressed the issue, providing a firm foundation for future research. Drawing largely on the (limited) work in mainstream psychology and the pioneering research in the L2 field by Pennington (1995) and Doyle and Kim (1999), I devoted a whole chapter in my general overview of L2 motivation (Dörnyei, 2001) conceptualizing and analyzing teacher motivation. During the past 18 months, some further data-based studies have contributed to our understanding of what makes teachers motivated and how this motivation is reflected in their students’ achievement in work by Jacques (2001), Kassabgy, Boraie, and Schmidt (2001), and Masgoret, Bernaus, and Gardner (2000).

Motivation and Learning Strategy Use

The relationship between learning strategy use and student motivation has been an issue of interest in educational psychology for a
decade. Learning strategies are techniques that students apply of their own free will to enhance the effectiveness of their learning; in this sense, strategy use, by definition, constitutes instances of motivated learning behavior. This close relationship between learning strategies and student motivation has been reflected by the fact that a well-known motivation test in educational psychology, the *Motivated Strategies for Learning Questionnaire (MSLQ)* (Pintrich, Smith, & McKeachie, 1989) provides a combined measure of university students' motivational orientations and their use of different learning strategies. Recently Brown, Cunha, Frota, and Ferreira (2001) have produced a Portuguese version of the test for the purpose of administering it in Brazil. In the L2 field, the systematic study of the interrelationship between motivation and learning strategy use was initiated in the mid-1990s by Schmidt, MacIntyre, and colleagues (e.g., MacIntyre & Noels, 1996; Schmidt, Boraie, & Kassabgy, 1996); building on these results, Schmidt and Watanabe (2001) have recently further investigated the topic by obtaining data from over 2,000 university students.

Demotivation

Motivation research typically conceptualizes a motive as a kind of inducement, that is, as a positive force whose strength ranges on a continuum from zero to strong. However, very little is usually said about motivational influences that have a detrimental rather than a positive effect on motivation, that is, which instead of energizing action, de-energize it. This gap is all the more surprising because in educational contexts demotivation is a regrettably common phenomenon. In a review of the few relevant L2 studies available (Chambers, 1993; Dörnyei, 1998b; Oxford, 1998; and Ushioda, 1998), I have concluded that demotivation is a salient phenomenon in L2 learning and that teachers have a considerable responsibility in this respect (Dörnyei, 2001). Of course, when interpreting demotivated student responses, we need to bear in mind Chambers' warning that we are living in an age when it is not cool for students to show enthusiasm for anything and Boredom is in (p. 14). In any case, much further research is needed to do this important motivational factor justice.

Willingness To Communicate (WTC)

A recent extension of motivation research with both theoretical and practical potential involves the study of the L2 speakers' willingness to engage in the act of L2 communication. Originally inspired by research in L1 communication studies (e.g., McCroskey & Richmond, 1991), MacIntyre, Clément, Dörnyei, and Noels (1998) have attempted to conceptualize *willingness to communicate* (WTC) in the L2, thereby explaining the individual's readiness to enter into discourse at a
particular time with a specific person or persons, using a L2 (p. 547). The L2 WTC construct we have conceived is made up of several layers and subsumes a range of linguistic and psychological variables, including linguistic self confidence (both state and trait); the desire to affiliate with a person; interpersonal motivation; intergroup attitudes, motivation and climate; parameters of the social situation; communicative competence and experience; and various personality traits. Thus, the model attempts to draw together a host of learner variables that have been well established as influences on second language acquisition/use, resulting in a construct in which psychological and linguistic factors are integrated in an organic manner. This line of inquiry may well have important educational implications in that generating a willingness to communicate in the foreign language is arguably a central if not the most central objective of modern L2 pedagogy. The study of the nature of WTC is an ongoing research effort (cf. e.g., MacIntyre, Babin, & Clément, 1999), and the WTC construct has also been successfully integrated as a predictor variable accounting for a very significant proportion of the variance in learner performance in the Dörnyei and Kormos (2000) study already mentioned.

**Motivating Language Learners**

From a practicing teacher’s point of view, the most pressing question related to motivation is not what motivation is but rather how it can be increased. It is an unflattering indication of the detachment of research from classroom practice that very little work has been done in the L2 field to devise and test motivational strategies systematically. To be fair, some practical recommendations have been offered by Alison (1993), Brown (1994), Chambers (1999), Dörnyei (1994), Oxford and Shearin (1994), and Williams and Burden (1997), but largely without any firm theoretical or empirical basis. The neglect of the study of motivational strategies is due in part to the fact that the experimental research required to test the effectiveness of a strategy is rather labor-intensive, and as Gardner and Tremblay (1994) summarize, offers many methodological pitfalls. The only published empirical study on motivational strategies that I am aware of in the L2 field is a teacher survey that I conducted with a colleague (Dörnyei & Csizér, 1998) in which we asked 200 teachers to rate the importance of a set of 51 strategies and to estimate how often they used the strategies in their own practice. As a result, we compiled a list of Ten commandments for motivating language learners. In addition, I have recently completed a systematic overview of all the major motivational strategies that have been documented in the educational psychological and second-language literature and summarized the findings in a teacher’s handbook (Dörnyei, in press-c).
There are two further areas related to the question of how to motivate learners: the issues of *motivational change* and *motivational self-regulation*. With regard to the former, there have been a number of empirical studies in L2 motivation research investigating the motivational effects of bicultural excursion programs, methodological interventions, intensive language programs, and study trips abroad (for reviews, see Gardner, 1985: Ch. 5; MacFarlane & Wesche, 1995; Morgan, 1993). Two recent large-scale investigations conducted in this vein are Inbar, Shohamy, and Donitsa-Schmidt (1999) and Inbar, Donitsa-Schmidt, and Shohamy (2001), both examining how the teaching of spoken Arabic affects the attitudinal/motivational disposition of Israeli school children.

_Motivational self-regulation_, or _self-motivation_, is an intriguing new area within motivational psychology, exploring ways by which we can endow learners with appropriate knowledge and skills to motivate themselves. Evidence that this idea is not completely naïve has been provided by the fact that in certain classrooms, even under adverse conditions and without any teacher assistance, some learners are more successful in keeping up their goal commitment than others. How do they do it? The only answer is that they apply certain self-management skills to overcome environmental distraction or competing/disturbing emotional or physical needs/states. Ushioda (1997, 2001) analyzes several of the positive motivational thinking patterns that help someone to keep going. Based on Kuhl's (1987) and Corno and Kanfer's (1993) pioneering taxonomies, I have suggested (Dörnyei, in press-c) that self-motivating strategies are of five main types: commitment control strategies, metacognitive control strategies, satiation control strategies, emotion control strategies, and environmental control strategies. Some of the actual strategies listed under these categories are, in fact, very similar to the _affective learning strategies_ conceptualized by Oxford (1990) and O Malley and Chamot (1990).

**Conclusion**

This brief and necessarily sketchy overview has hopefully demonstrated that L2 motivation research is currently flourishing. The pioneers of the field have been joined by a new generation of international scholars and the scope of motivation research has been extended to cover a variety of related issues. As a result, we now have a vibrant mixture of approaches to the understanding of L2 motivation, comparable on a smaller scale to the multi-faceted motivational arena in psychology generally. The renewed interest in L2 motivation is at the same time indicative of a more general trend in applied linguistics whereby an increasing number of scholars combine psychological/psycholinguistic and linguistic approaches in order to better understand the complex mental processes involved in second language acquisition.
ANOTATED BIBLIOGRAPHY

Gardner and Clément’s chapter in the first edition of Handbook of Language and Social Psychology provided an excellent summary of the social psychological perspectives on second language acquisition, and the authors have now completely revised their chapter for the second edition.

This book offers an up-do-date overview of L2 motivation research from three broad perspectives: (a) theoretical approaches (both in mainstream psychology and in L2 studies); (b) pedagogical implications (including motivational strategies, demotivation, and teacher motivation); and (c) research methodology. It also contains a section offering a variety of resources such as lists of relevant databases and actual motivation questionnaire items successfully used in the past.

This edited volume, containing 20 newly written chapters, offers a representative cross-section of contemporary motivation research in the L2 field. Authors include some of the field’s most established researchers from over ten different countries in Asia, Europe, and the Americas.

This is a very thorough review of the most recent literature in mainstream motivational psychology, also covering a number of cutting-edge research directions, particularly within the area of social motivation.

This authoritative summary of research on motivation to learn by two of the leading American experts is a must for anyone interested in motivation on any sort of professional basis.

This extensive paper provides evidence of the richness of data that a qualitative study on motivation can offer. The author presents some groundbreaking insights into the dynamics of motivational processes over time as well as into language learners’ self-motivating capacity.
