

# OBX UHD-HDR Triple Expand

**ARENA**

## Unit Summary

Arena pioneered the World's first full-scale implementation of data over IP in an outside broadcast truck. The aim being to provide a fully glass-to-glass IP workflow. Hundreds of OBs later it has proven a solid decision.

Why is IP important? Traditional baseband technology is effectively point-to-point using copper cable. This legacy technology requires 4 paths to move a UHD signal (routed as 4x quad-HD tiles). In an environment where space and weight are at a premium, this limits the power of the OB unit. It also means key equipment like Routers and Vision mixers have 4 inputs and outputs in use for every signal path.

IP allows the Production team to produce UHD content of the same scale and complexity previously used for HD and then some with the option of HDR PQ (ST2084) and HLG (hybrid log gamma). The OB unit can multi-cast in SD, HD (1080 50i), HD (1080 50P) and UHD. UHD content can be produced in High Dynamic Range (HDR) whilst producing legacy feeds in Standard Dynamic Range (SDR). Our IP truck design is now well proven working regularly on numerous high-profile events.
