UNIVERSAL ROW CROP CULTIVATION TECHNOLOGY

Einböck

UNIVERSAL ROW CROP CULTIVATION TECHNOLOGY

CHOPSTAR
ROLLSTAR
HILLSTAR
ROW-GUARD
JUMBO
In contrast to chemical weed control the mechanical approach does not only control weeds, but also achieves excellent results in soil aeration, nitrogen mobilization, regulation of the water balance etc.

To be successful in the long term, however, basic agronomic considerations in all aspects of crop production must be made:

- Efficient primary tillage builds the basis for successful mechanical weed control.
- All tillage operations must fulfill the killing objective, the planted seed competes only against seeds, not mature plants.
- Seeding depth has an indirect influence on successful mechanical weed control. Blind cultivation enables you to destroy a large amount of weeds, whereby the best result is achieved when the weeds are in the germinating stage. This operation shall not harm the germinating seeds. Blind cultivation with the Einböck AEROSTAR, the AEROSTAR-EXACT and the AEROSTAR-ROTATION between seeding and germination of the crop is only possible with an increased seeding depth.
- The crop rotation should involve a wide variety of different crops. Proper crop rotation can help to prevent the massive appearance of problem weeds.
- Nitrogen considerations: excessive use of nitrogen-based fertilizer leads to a high amount of problem weeds.
- Seedbed preparation constitutes an essential precondition for the success of mechanical weed control. Good soil conditions and seedbed preparation at the earliest possible moment are prerequisites for any mechanical weed control. Einböck offers a large variety of machinery for seedbed preparation.
**HILLSTAR** – this is what Einböck calls ridgers for hill-crops with large, concave discs. These machines are used to push soil up in hill-crops. A pre-loosening tine breaks up the soil and the inclined discs transport the earth, pulled down by erosion, up the hill again.

Due to the large smooth discs no hair roots of the crop close to the surface are harmed. The discs have high quality, maintenance free bearings and can be ideally adjusted in the angle. The optional guided hill-weeder (3 sections) additionally fights weeds.

**ROLLSTAR** – these are the row-crop cultivators with rolling hoe-stars. These cultivators are mainly used in light soils. This machine is mainly used by clients who want to use it on a variety of crops like potatoes, vegetable, corn, etc.

Depending on the row spacing the machine is equipped with a variable number of rolling hoe-stars. Height adjustable pre-loosening tines in front of the stars support the work for the following stars.

For a wider row spacing or weeding width two pre-loosening tines are used. As the stars can be pivoted horizontally and vertically, the soil flow can be directed towards or away from the crop, plus small hills can be maintained. Upon request the machine can be equipped with hinged crop protection shields or hill-weeders. In case you want to use the ROLLSTAR as a front mounted implement you need a special front mounting support which is available upon request.

General: Page 4-11
Detailed description HILLSTAR: Page 24 and 25

General: Page 4-11
Detailed description ROLLSTAR: Page 22 and 23
CHOPSTAR – these are the cultivators equipped with spring tines or vibrotines. These cultivators are mainly used in medium to heavy soil and only for a particular crop, e.g. beet or corn. Depending on the desired working depth the tines and sweeps can differ. For row spacing larger than 60 cm / 23.6” shares and tines for greater working depths are offered.

For narrow row spacing special vibrotines equipped with shallow working sweeps are recommended. The number of tines and the width of sweeps per hoe section depend on row distance and weeding width. Furthermore, adjustable crop protection shields or rolling discs to protect the small plants in the first weeding operation are available.

The CHOPSTAR design allows you to convert a rear-mounted machine quickly to a front mounted one. Front mounted machines push the parallelograms, that results in a close mounting of the row crop cultivator.

On the hoeing-sections a lot of different options like hilling elements, hilling sweeps, weeder tines, finger-hoes, etc. can be mounted.

**ROW SPACING:**

**CHOPSTAR 20-30 cm**
- 7.9-11.8”
- GRAIN

**CHOPSTAR 25-59 cm**
- 9.8-23.3”
- SOYBEANS, BEET...

**CHOPSTAR 60-90 cm**
- 23.6-35.4”
- CORN, SUNFLOWER...

**CHOPSTAR 91-150 cm**
- 35.8-59”
- PUMPKIN, CAULIFLOWER, STRAWBERRY...

General: Page 4-11
Detailed description CHOPSTAR: Page 12 to 21
Frame for a rear-mounted machine with upper-link steering

Frame for a front mounted machine

Frame for a front mounted machine, hydraulic folding

Frame for a rear-mounted machine, hydraulic folding with upper-link steering
Frame for a rear-mounted machine with double folding frame (4 hinge points) for reduced transport width for large machines. The frame, on which the parallelograms are mounted, is available in a rigid or a hydraulic folding version.

The special profile-frame used by Einböck, allows mounting of the parallelograms through a single clamp lever.

SIMPLY AND QUICKLY ADJUSTABLE

STRONG FRAMES FOR HIGH LOADS
The working depth of the hoe element can be adjusted through the spindle of the Farmflex feeler wheel. The tension spring and the adjustment bracket control the downforce of the parallelogram.

**Upper-link steering** for exact weeding even in hilly terrain and in curves (rear mount machines only).

**High-gauge wheels** provide an optimal guidance of the row crop cultivator (rear mount machines only). The weight of the cultivator is carried by the gauge wheels, therefore traction of the front wheels is not effected.

The action of the **upper link steering** can be increased hydraulically. At the headland the cylinder always has to be switched to the other direction. It is recommended for slopes over 6 %.

**Clevis mounting brackets** with removable pin.
Due to agronomical, organizational or commercial reasons mainly herbicides were used to keep weeds in check in the past. This chemical weed control reduced costs and efforts while at the same time it helped to increase profits and to stabilize crop yield. This resulted in the fact that typical “cultivation crops” have turned into “chemical crops”. Lately, because of the significant disadvantages of chemical weed control, an increased interest in mechanical weed control can be realized. The following reasons are basis for this trend:

• The appearance of difficult to control weeds that have partially become resistant against certain groups of herbicides
• A ban on a number of pesticides
• A drastic price increase of pesticides
• The general focus on environmental care
• The tolerance of an acceptable amount of weeds in the field
• Improved machine range: upper-link steering for rear mounted machines, ROW-GUARD camera guided steering system

Mechanical weed control also has positive aspects on the soil:

• Increased aeration
• Disruption of the capillary action
• Breaking of crusts
• Conservation of soil nutrients that are often destroyed or displaced by chemical releases
• Biological life is sustained
• The natural soil microorganisms ensure good plant health

**HIGHER YIELDS AND BETTER QUALITY**

**WITH WELL-MAINTAINED ROW CROPS**
Because the front-view to the crops is often restricted, front mounted machines are standard equipped with a track indicator.

Warning signs and lights are available for an extra charge.

Depending on the number of rows, rear-mounted machines are equipped with an automatic upper-link steering system. It allows operation on slopes up to 6%. In turns or contour strips the cultivator will follow exactly the tractor. The steering is done via high gauge-wheels so there is no need for the tractor to carry the machine. It is operated with activated automatic hitch control and freely movable lower links (approx. 7 cm / 3” each side). This ensures that the front wheels of the tractor retain full traction, which gives a better maneuverability, especially in hilly terrain.

Standard equipment CHOPSTAR, ROLLSTAR and HILLSTAR

- Clevis mounting brackets with removable pin
- Rear-mounted machines with automatic upper-link steering including upper link (adjustable in length) and high-gauge wheels
- Front mounted machines with track indicator for improved guidance
- Downpressure adjustments on all parallelograms
- Heavy duty designed parallelograms
- Farmflex depth control wheels, ø 300 mm / 11.8”, 100 mm / 4” wide, ball bearings, adjustable via a hand crank
- Operating instructions
STANDARD EQUIPMENT

CHOPSTAR, ROLLSTAR, HILLSTAR

- Heavy duty frame (special design, no U-bolts used)
- Hydraulic folding machines with extra-strong triple frame
- Greasing points on all joints
- High quality tines and sweeps
- Rear-mounted machines (depending on the number of rows) with automatic upper-link steering and high-gauge wheels with stripper and splash guard
- Quick adjustment of the parallelograms
- Easy vertical and horizontal adjustment of the tines
- Easy conversion from rear- to front mount, no additional parts necessary (only possible on the standard version of CHOPSTAR row crop cultivator)

All row crop cultivators, CHOPSTAR, ROLLSTAR or HILLSTAR, are equipped with the same, wide parallelogram with downpressure adjustment and Farmflex depth control wheel.

Hoe element parallelogram on front mounted machines (only on CHOPSTAR)

Hoe element parallelogram on rear-mounted machines
Standard equipment
CHOPSTAR 20-30 cm / 7.9-11.8"

Variable adjustment of row spacing 20-30 cm / 7.9-11.8"
Clevis mounting brackets
Mounting category CAT II
Rear mounted machines: autom. top link steering with top link and high-gauge wheels
Downpressure adjustment on each parallelogram
Farmflex depth control wheels adjustable by hand crank
Heavy duty designed parallelograms
Special vibrotines are adjustable horizontally and vertically
Front mounted machines with track indicator for guidance
Quick conversion from rear to front mount
Hoe element with 1 sweep 180 mm / 7”
Operating instructions

Optional equipment
CHOPSTAR 20-30 cm / 7.9-11.8"

Frame extension
Adjustable weeder tines (see page 20)
Additional parallelogram guided hinged crop protection shields, adjustable in height,
from a row spacing of 25 cm / 9.8” (see page 13)
Upper link Cat. III for rear mount machines with upper-link steering
Vibrotine with mounting brackets and special-nut
Sweeps from 120-300 mm / 4.7-11.8”
Warning signs with lights
Pneumatic intercrop seeder / fertilizer distributor

Hoe section **CHOPSTAR 20-30 cm / 7.9-11.8”** with vibrotine and duckfoot sweep

**Hinged crop protection shield** for hoe section **CHOPSTAR 20-30 cm / 7.9-11.8” from a row spacing of 25 cm / 9.8” (optional)**
### Standard equipment

**CHOPSTAR 25-59 cm / 9.8-23.3”**

- Variable adjustment of row spacing 25-45 cm / 7.9-17.7” (plant protection discs or shields not possible)
- Variable adjustment of row spacing 37-45 cm / 14.6-17.7” (plant protection discs or shields are possible)
- Special vibrotines are adjustable horizontally and vertically
- Parallelogram-guided hinged crop protection shields (adjustable in position) or rolling discs
- Complete hoe element with 2 duckfoot sweeps 140 mm / 5.5”, 1 duckfoot sweep 160 mm / 6.3”
- Half hoe element with 1 duckfoot sweep 140 mm / 5.5”, 1 duckfoot sweep 160 mm / 6.3”

### Optional equipment

**CHOPSTAR 25-59 cm / 9.8-23.3”**

- Frame extension for wider row spacing
- Adjustable weeder tines – also for working in the row (see page 20)
- Finger weeders for work in between the plants (see page 21)
- Heaping share for vibrotine (see page 20)
- Hydraulical or mechanical steering support (not possible on all machines)
- Warning signs and lights
- Pneumatic intercrop-seeder / fertilizer distributor
- Angle-knives (see page 20)

¹ for a row spacing of 150 cm / 59”
² hydraulic folding - triple-frame

Technical data and measurements are approximate and non-binding. We reserve the right to change construction and specification.

Optional equipment CHOPSTAR 91-150 cm / 35.8-59”

- Frame extension for wider row spacing
- Spring-mounted hilling element (see page 20)
- Adjustable weeder tines – also for working in the row (see page 20)
- Hydraulic or mechanical steering support (not possible on all machines)
- Finger weeders for work in between the plants (see page 21)
- Pneumatic intercrop-seeder / fertilizer distributor
- Warning signs and lights

Standard equipment
CHOPSTAR 91-150 cm / 35.8-59”

- Variable adjustment of row spacing 60-150 cm / 23.6-59*
- Rear tine with reinforcement spring, height adjustable
- Excellent horizontal tine adjustment
- Parallelogram-guided hinged crop protection shields or rolling discs (adjustable)
- Hoe sections with duckfoot sweeps 180 mm / 7.1”

Technical data CHOPSTAR 91-150 cm / 35.8-59”
Hoe section CHOPSTAR 91-150 cm / 35.8-59” complete, with hinged crop protection shields and Danish spring tines
Adjustable weeder tines for CHOPSTAR 20-30 cm / 7.9-11.8", CHOPSTAR 25-59 cm / 9.8-23.3" and CHOPSTAR 60-90 cm / 23.6-35.4".

The outer tines on each section can be turned around, in order to push soil away from or towards the row (not on CHOPSTAR 20-30 cm / 7.9-11.8").

Straight or cranked angle knives are available on request.

This hilling element can be mounted instead of the rear tine of the CHOPSTAR 60-90 cm / 23.6-35.4" to maintain potato hills or hill crop rows.

Heaping shares are used for hilling up the plant rows. They can be mounted on the holder of the vibrotine as well as on the Danish spring tine.

Reinforcement spring for the Danish spring tine and the vibrotine.
Depending on the row spacing the vibrotines are offered with 120-300 mm / 4.7-11.8" wide duckfoot sweeps.

The finger weeders work in between the plants in the crop row. For the front version additional support wheels are required.
## Standard equipment ROLLSTAR

Variable adjustment of row spacing 30-70 cm / 11.8-27.6”
- vegetable and beet 30-50 cm / 11.8-19.7”
- corn 60-70 cm / 23.6-27.6”

1. height-adjustable pre-loosening tine with duckfoot sweep per hoe section on the potato or vegetable version
2. height-adjustable pre-loosening tines with duckfoot sweeps per hoe section on the corn version

Hoe stars mounted on angular roller bearings, individually removable
Hoe stars made of high wear-resistant material

## Optional equipment ROLLSTAR

Frame profile extension for wider row spacing
Guided hill-weeder (3 sections)
Hydraulic or mechanical steering support (not possible on all machines)
Front mounting support
Warning signs and lights
Pneumatic intercrop-seeder / fertilizer distributor

---

---

1. for a row spacing of 70 cm / 27.6” (potato, corn) respectively 45 cm / 17.7” (beet, vegetable
2. hydraulic folding - triple-frame
3. hydraulic folding - double folding frame, folds to 3.00 m / 9.8 ft transport width (paket-folding)
4. 4 high-gauge wheels instead of upper link steering
5. with support - gauge wheel behind the tractor track

---

Technical data and measurements are approximate and non-binding. We reserve the right to change construction and specification.
When the ROLLSTAR is used front mounted, a special front mounting support is used.

Guided hill-weeder (3-sections) for covering and pulling out weeds along the potato hills.

Example: ROLLSTAR Potato EKR 4-rows

### Optional equipment HILLSTAR

- Frame extension for wider row spacing
- Guided hill-weeder (3 sections)
- Hydraulic or mechanical steering-support (not possible on all models)
- Pneumatic intercrop-seeder / fertilizer distributor
- Warning signs and lights

---

**Standard equipment HILLSTAR**

- Soil loosening tine with 180 mm / 7.1” sweep
- Row spacing variable adjustable 65-70 cm / 25.6-27.6”
- Hoe section complete with 1 sweep 180 mm / 7.1” and double disc
- Hoe section half with 1 sweep 180 mm / 7.1” and single disc
- Hilling discs laterally adjustable
- Exact adjustment of the angle of the discs

---

**Technical data HILLSTAR**

- Length of frame profile = row spacing x number of rows + 20 cm / 7.9” (transport width will change)

---

¹ for a row spacing of 70 cm / 27.6”
² hydraulic folding – triple frame
³ hydraulic folding - double folding frame, folds to 3.00 m / 9.8 ft transport width (4 Fold)
⁴ 4 high-gauge wheels instead of upper link steering
⁵ mit Zwischenbock - Spurkranzräder hinter der Traktorspur
Guided hill-weeder (3-sections)

HILLING OPERATION

EFFICIENT

HILLSTAR
The steering system precisely recognizes green crop in rows. The color of the soil has to be brown or black. Easy, operator-friendly adjustment of the system to the different crop rows. The big field of vision over several rows ensures good guidance also in fields with high weed pressure. The two lenses of the camera have different exposure settings, what minimizes the influence of shade (also in strong sunlight).

**TECHNICAL HIGHLIGHTS**

- Quick couplers on the lower links simplify mounting of the hoe
- Lower- and upper links are equipped with hardened bushings
- Big offset of total 500 mm / 19.7” – corrects even serious aberration from the path
- Solid holder for camera with quick couplers to adjust the position and the angle of the camera without tools

---

**Standard equipment ROW-GUARD**

Sideshift frame with offset of 500 mm / 19.7” in total
Clevis mounting bracket
Upper- and lower links equipped with hardened bushings
Quick couplers for easy and quick attachment of the hoe
Guidance shaft made from high-strength, coated metal for minimized wear and tear
Camera with 2 lenses with different exposure for improved operation in changing light conditions
Holder for camera for Einböck hoes
Wheel sensor with holder and connection cable suitable for farmflex wheels of Einböck hoes
Sensor on the upper link to determine the position of the 3 point linkage
Control unit with universal holder for the tractor cabin
Parking support
Storage box for camera and control unit
1 single acting hydraulic valve with pressure-free return line and 12 V power plug necessary
Operating instructions

---

</tbody>
</table>

1 for frames up to 6,99 m / 22.93 ft working width
2 for frames up to 12,2 m / 40 ft working width
3 for frames from 12,2 m / 40 ft working width

---

**Optional equipment ROW-GUARD**

Xenon-working light for operation during night
Stabilizing discs – recommended for small tractors (upon request)
Extension cable for camera
Extension cable for wheel sensor
Additional wheel sensor with holder for additional hoes
Additional holder for camera for additional hoes
Ground wheel with sensor – necessary for other brand hoes
The ROW-GUARD camera steering system guides hoes precisely, even in high speed. Via a control unit in the tractor cabin the precision guidance system can be adjusted comfortably. The picture captured by the camera is being analyzed on spots with a high concentration of green pixel. With help of the available information about row-configuration of the crop (row spacing, number of rows, etc.) a raster is put on top of the picture. This data builds the basis for the information provided to the sidemesh frame which guides the hoe exactly in between the rows.

All the advantages of the ROW-GUARD system are obvious:
- Improved working accuracy
- In combination with finger weeders all soil is distributed
- Extremely efficient weed control

Extremely high working speed (up to 15 km/h - 9.3 mph, depending on field conditions) are possible, depending on field and crop conditions.

The operator does not get tired so quickly, the required concentration is limited to stay in between the rows – the exact steering is done by the ROW-GUARD steering system.

The system can be used in various different green crops, independently from row spacing, number of rows, etc.
The **hydraulic fan** produces the necessary airstream to transport the fertilizer or the seeds from the seeding unit to the rear mounted distribution heads and further on to the outlets. From a transport distance of the seeds of 10 m the optionally available rotary airlock ensures that the airstream does not escape via the seeding unit and that the necessary air pressure is available.

The **seeding roller** is driven by a big ground wheel and therefore the distribution rate is always adjusted to the working speed. With the hydraulically liftable ground wheel the JUMBO can be mounted to the tractor without hydraulic front linkage.

The **seeding volume** is regulated by a lever and different seeding rollers. The machine is supplied with two seed metering rollers allowing distribution of nearly every seed or fertilizer (independent from the seed or particle size).

---

**Standard equipment front-tank JUMBO**

- 1500 l / 42.5 bu / 53 cu-ft tank volume
- Seeding unit made from stainless steel - painted
- Hydraulic fan (1 single acting hydraulic valve with up to 30 l/min - 1.14 bu/min - 1.06 cu-ft/min capacity and pressure free return line with ¾" coupling necessary)
- Big ground drive wheel with hydr. lifting cylinder (1 single acting valve necessary)
- Variable gearbox for quantity regulation
- Disconnectable agitation shaft
- Up to 4 seed metering rollers
- Calibration pan
- Operating instructions

---

**Optional equipment front-tank JUMBO**

- Rotary airlock (necessary for seed transportation above 10 m / 33 ft)
- Hydr. hose set (when the tractor has hydr. valves only at the rear)
- Lightning
- Parking support
- Filling steps

---

The front JUMBO tank gives the opportunity to distribute seeds or fertilizer when working with folding row-crop cultivators and provides improved weight distribution! The tank has a volume of 1500 litres / 42.5 bu / 53 cu-ft and can work in combination not only with various different rear mounted row-crop cultivators, but also with various different types of rear mounted machines (e.g. tined weeder, field cultivators,...).
**INTERSOWING**

**IS THE BEST EROSION PROTECTION**

For the distribution of seeds (or fertilizer) you can mount our pneumatic seeding boxes **P-BOX-MD, P-BOX-ED** and **P-BOX-STI**.

You can find further information in our leaflet for the seeding boxes!

For rigid CHOPSTAR 60-90 cm / 23.6-35.4", ROLLSTAR Corn or HILLSTAR mechanical fertilizer distributors made from stainless steel are available.
INDIVIDUAL SOLUTIONS
TUNED TO YOUR REQUIREMENTS

We can produce a row-crop cultivator for nearly all row crops for you. But we need the following information:

- Row spacing
- Number of rows on the planter or drill you used
- Choose front or rear mounting of the row-crop cultivator (or rear mounting in combination with the ROW-GUARD camera steering system)
- Cultivating width per section (how wide is the initial strip you want to leave unworked)
- In special crops – how deep shall the row-crop cultivator work?
- Are the rows centred between the tractor wheels?
- Hitch category of the tractor
- Track width of the tractor
