Warehouse Management

Warehousing as Part of Our Asset Management Features

Our warehousing system is actually a stand-alone instance of our Active Supply Chain Management (Active SCM) system. Purchase orders from your A/P system are electronically transmitted to our system. The Warehouse Specialists at each location perform 3-way matching of PO items, to packing slips and to items received. The items are real-time scanned into inventory and automatically classified.

At any point in time, the user may view accurate inventory levels by classification including warehouse, location, asset type, and material group code or part number. Picks from the warehouse may be easily initiated using either of the standard classifications.

More importantly, the user can set up key Tracking Indicators to proactively manage warehouse contents, commodity costs or dollar valuations. In addition we maintain, daily milestone tracking by each of the standard classifications.

Warehouse Management Features:

In addition to the items below, our Warehouse Management System includes all [Asset Management features](#) the as well.

- Real-time Pick creation from scratch or copy favorites
- Pick individual based on key word searches, part numbers, asset types or material group codes within warehouses
- Pick classifications (Pull From Stock, Transfers, Ship To's, etc.)
- Item lookups by warehouse, asset type, part number, key word, or manufacture to view
 - Availability
 - Quantity of stock pending picks, checked out or on order
 - Reorder minimums
 - Master part listings
- Design "Pick Bundles" for commonly group items
- Daily historical warehouse reporting by classification
- Real-time reporting of:
 - Purchase order received summary and detail
 - Pick order summary and detail
 - Purchase order items not received
- Receipt integration back to your A/P and/or Asset Control systems

Warehouse Scanning System

The warehouse inventory scanning system is integrated with our Active SCM system. It's designed to maintain real-time information of all warehouse activity. There's no scanner synchronizations required. Receive or pick an item and immediately see the impact to inventory levels.

Warehouse Scanning Features:

- Receipts
- Receive add-on parts to purchase orders
- Picks
- Adds to warehouse
- Returns to warehouse
- Inventory moves
- Automatically creates help desk tickets
- Help desk tickets can be cross-referenced back to initiating orders
- Receipts automatically update order status
- All historical transactions retained for reporting
- Directly interfaces to Accounting Reconciliation sub-system
- Supports DOA and back-order items
