Everolimus rescues multiple cellular defects in laminopathy-patient fibroblasts

GENETICS Correction for “Everolimus rescues multiple cellular defects in laminopathy-patient fibroblasts,” by Amanda J. DuBose, Stephen T. Lichtenstein, Noreen M. Pettrash, Michael R. Erdos, Leslie B. Gordon, and Francis S. Collins, which was first published March 26, 2018; 10.1073/pnas.1802811115.

The authors note that Fig. 6 appeared incorrectly. The corrected figure and its legend appear below.

Fig. 6.
Senescence-associated β-galactosidase staining of everolimus-treated and control-treated cells. Cells were treated three times per week with 0.1 μM everolimus or vehicle control. Passage (P) number of each cell line is indicated in the lower left corner. (Scale bar: 100 μm). All control lines have β-galactosidase–positive cells (indicated by blue staining), but everolimus-treated lines are negative.

Published under the PNAS license.

Core Concept: Microgrids offer flexible energy generation,
for a price
Already in the works in several places, microgrids could prove very useful for remote or vulnerable locales such as Puerto Rico, as well as those areas seeking grid independence—if, that is, technical and regulatory hurdles can be overcome.
